

The uncertainty related to the climate reconstruction is shown for the minimum January temperature (Tjan), maximum July temperature (Tjul) and annual precipitation (Pann). The standard error is calculated from the range of the 95% confidence interval as $range/3.92$ (assuming a normal distribution). The boxplots show the overall variation of the reconstruction uncertainty per age using all available sites. The raw values used to generate the plots are given for the Tjan (Table 1), Tjul (Table 2) and Pann (Table 3).
