Supplement of

NALPS19: sub-orbital-scale climate variability recorded in northern Alpine speleothems during the last glacial period

Figure S1: Samples analysed in this study. Black scale bars = 5cm.

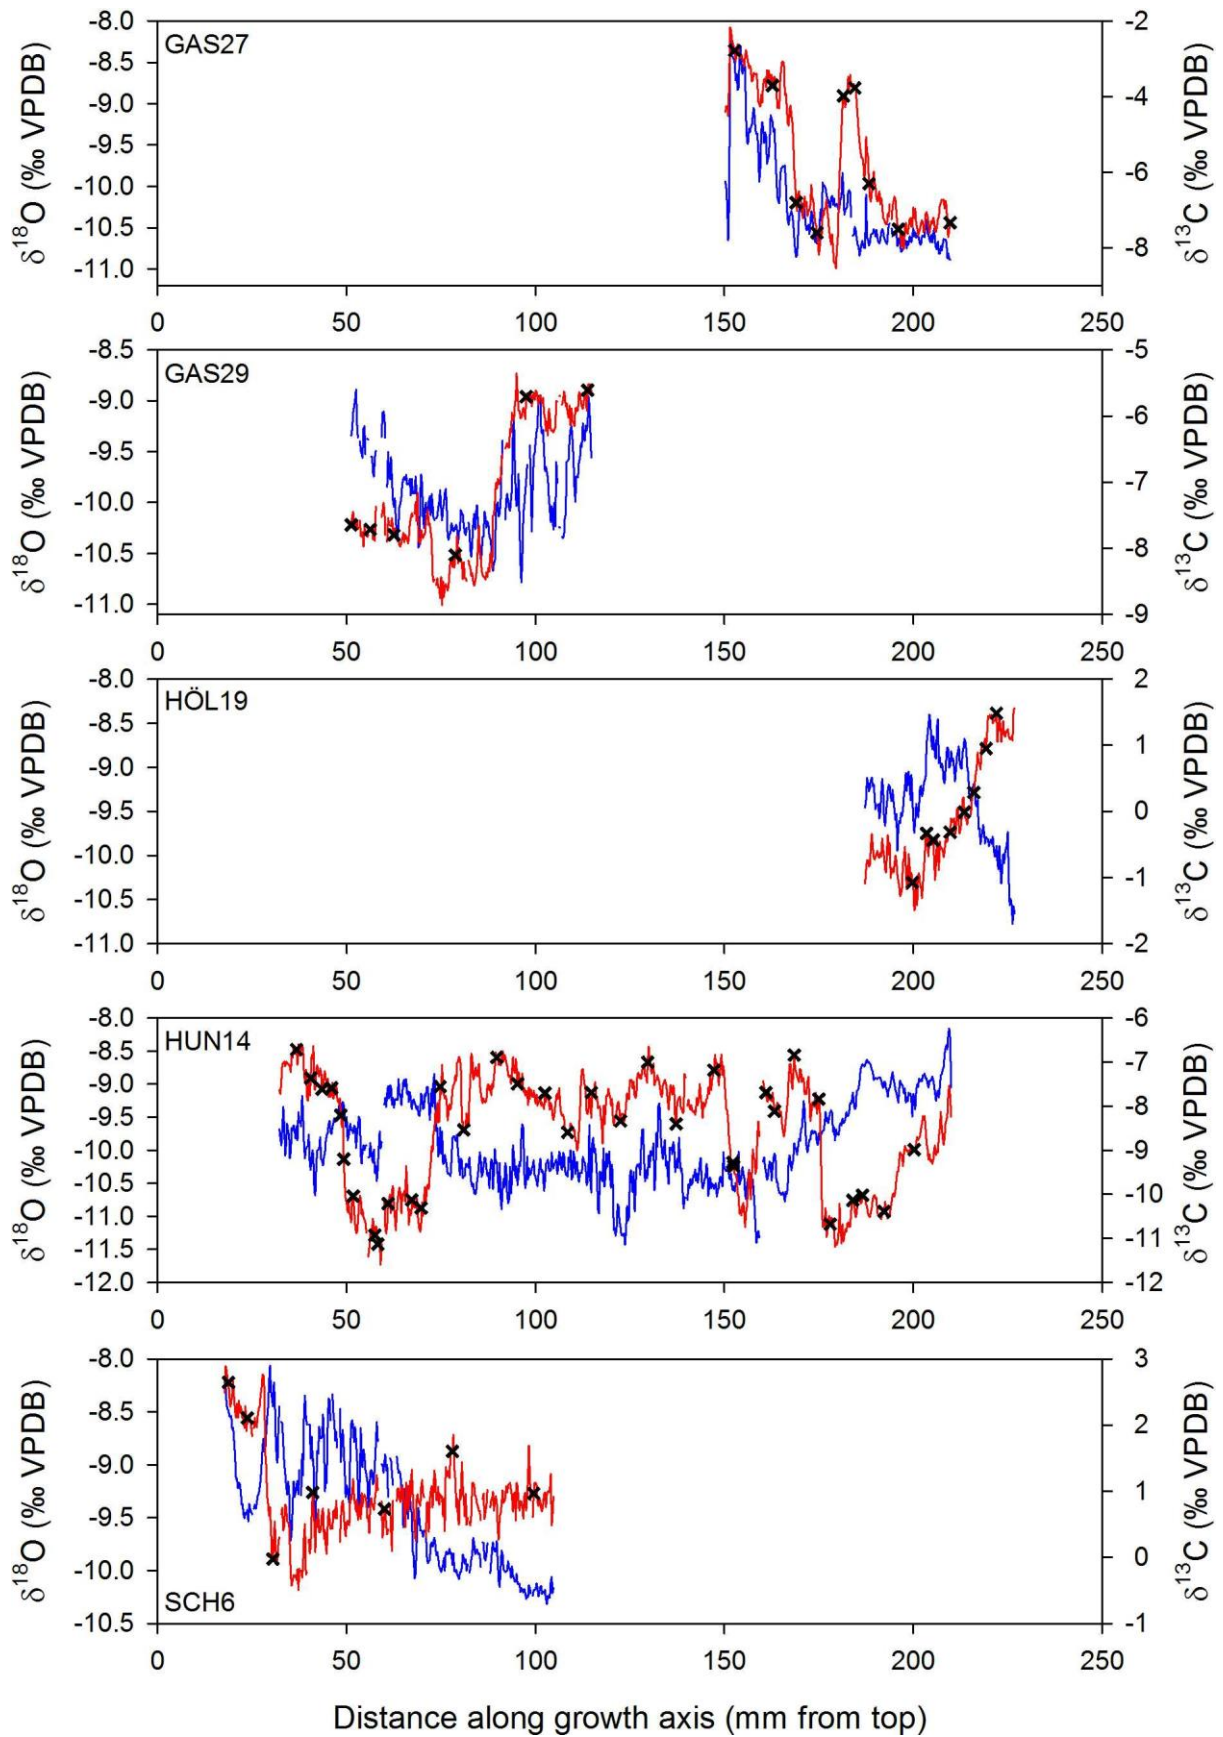

Figure S2: $\delta^{18}\text{O}$ (red) and $\delta^{13}\text{C}$ (blue) for each sample measured in this study relative to distance along growth axis. Black crosses mark locations of U-Th dating locations.

Table S1: MC-ICP-MS U-Th dating results of samples analysed in this study.

mm dft = distance from top in mm.

All uncertainties are 2σ .

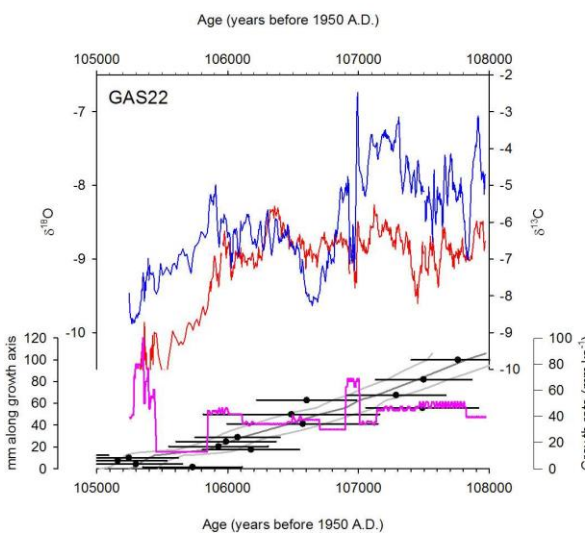

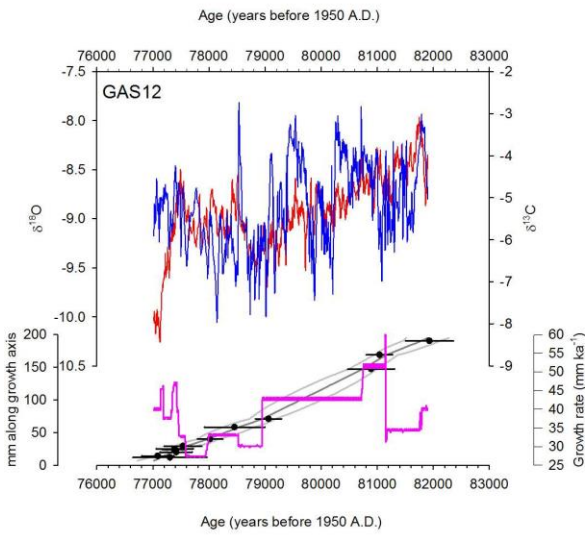

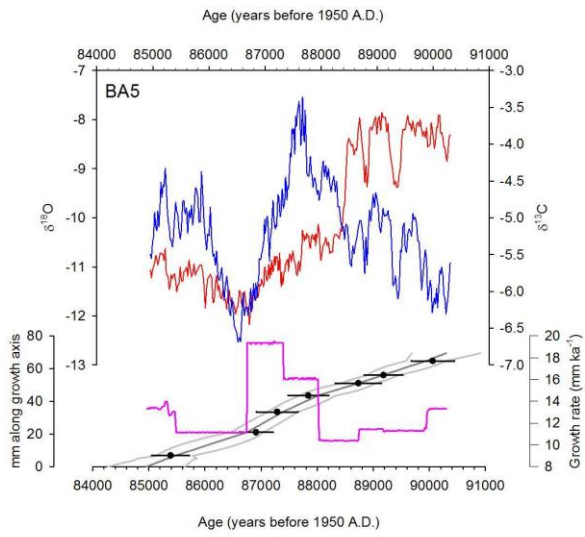

* $\delta^{234}\text{U} = ([^{234}\text{U}/^{238}\text{U}]_{\text{activity}} - 1) \times 1000$.

† $[^{230}\text{Th}/^{238}\text{U}]_{\text{activity}} = 1 - e^{-\lambda_{230}T} + (\delta^{234}\text{U}_{\text{measured}}/1000)[\lambda_{230}/(\lambda_{230} - \lambda_{234})](1 - e^{-(\lambda_{230} - \lambda_{234})T})$, where T is age in years. $\lambda_{230} = 9.1705 \times 10^{-6} \text{ a}^{-1}$ (Cheng et al., 2013),

$\lambda_{234} = 2.8221 \times 10^{-6} \text{ a}^{-1}$ (Cheng et al., 2013), $\lambda_{238} = 1.551 \times 10^{-1} \text{ a}^{-1}$ (Jaffey et al., 1971).

§ Years before measurement and without detrital Th correction.

Years before 1950 A.D.. Most samples corrected for detrital Th contamination using the bulk earth atomic value of 4.4 ± 2.2 ppm for initial $^{230}\text{Th}/^{232}\text{Th}_{\text{act}}$ (Wedepohl, 1995). Höl-19 is corrected using an isochron derived value of $2.28 \times 10^{-6} \pm 0.86 \times 10^{-6}$, which is inline with previous estimates from this cave (Moseley et al., 2014). The degree of detrital ^{230}Th contamination is indicated by the measured ($^{230}\text{Th}/^{232}\text{Th}$) activity ratio.

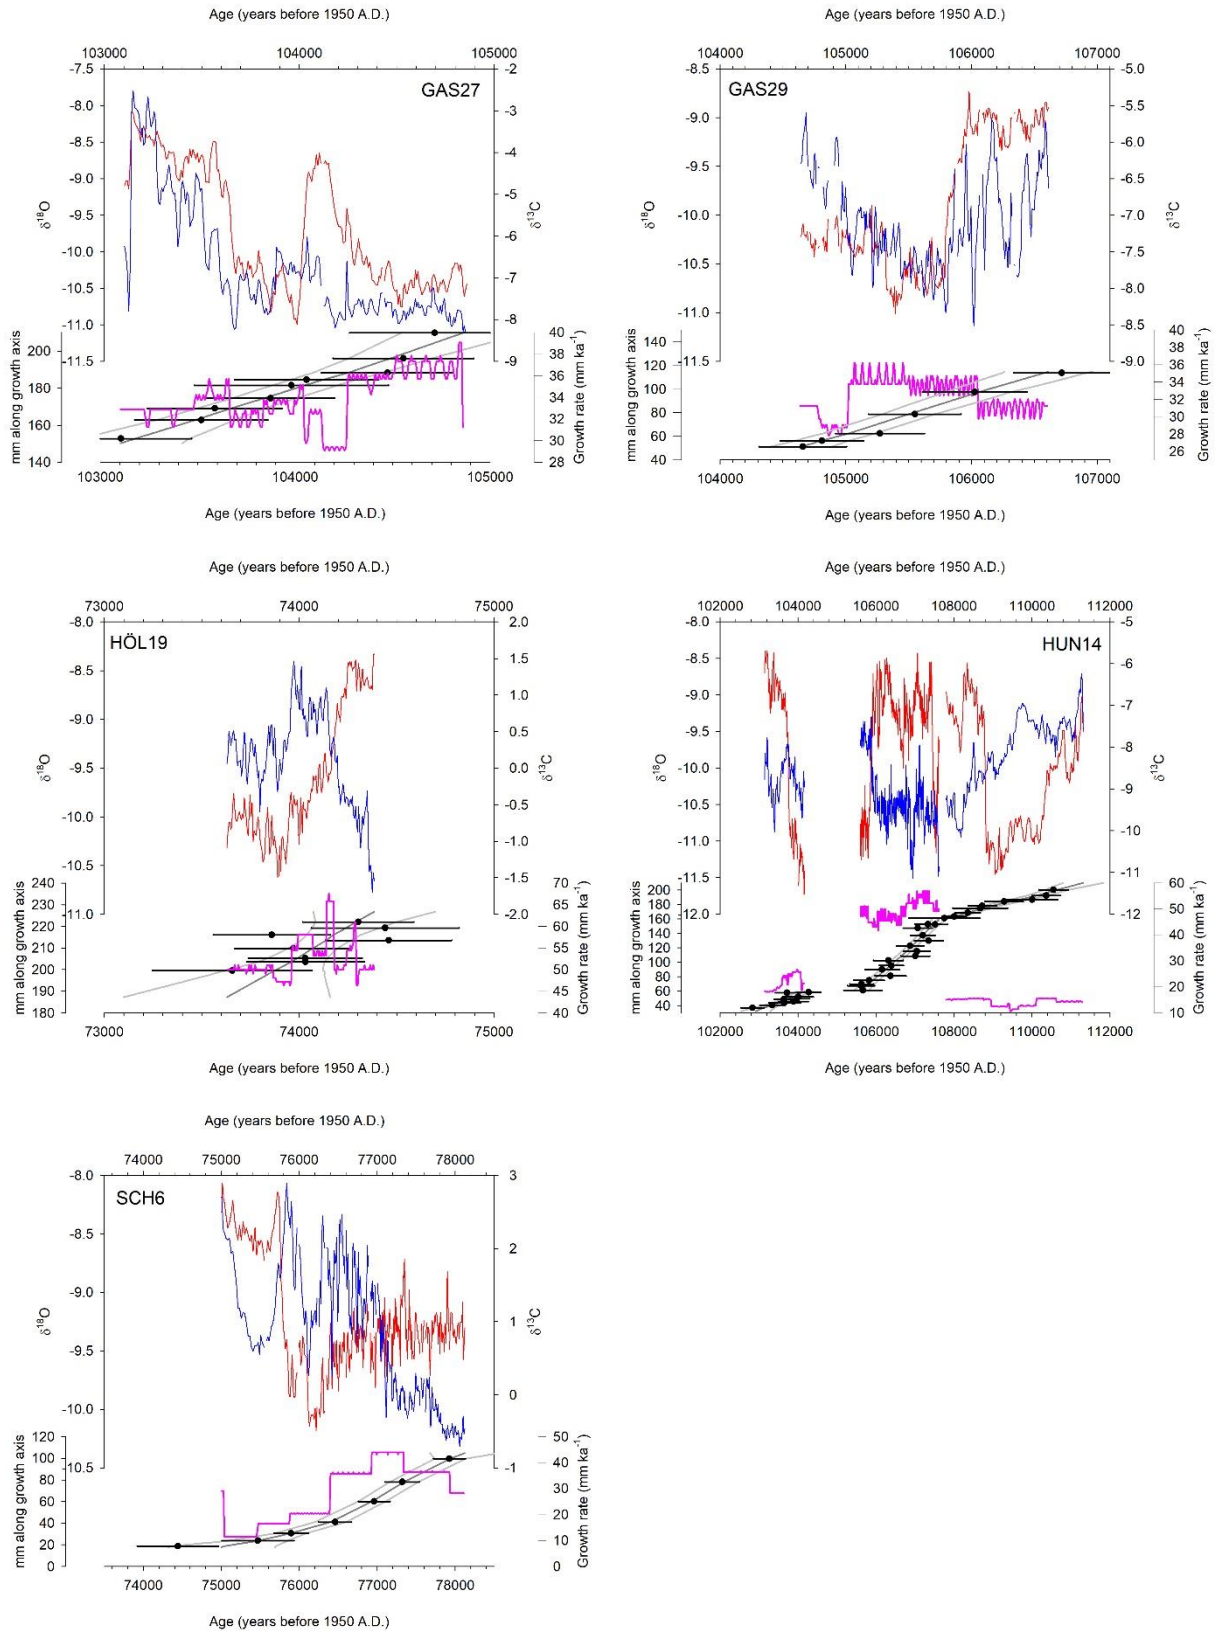

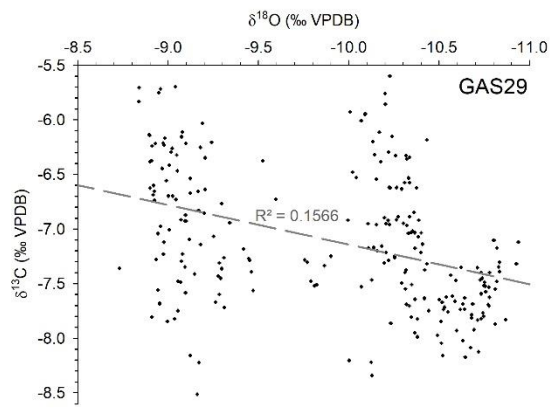

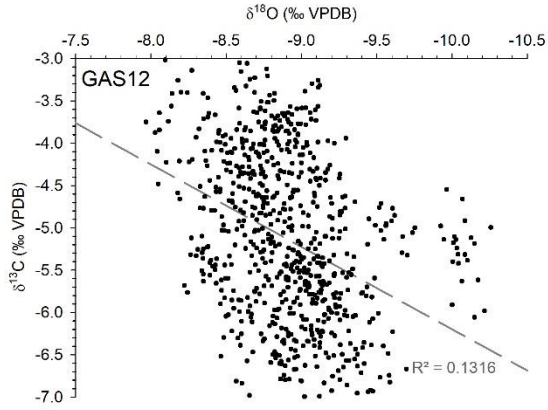

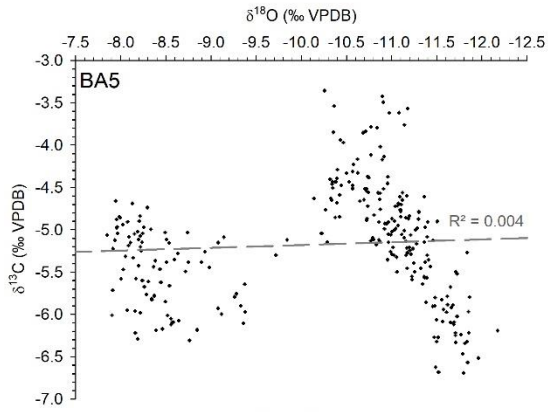

Figure S3: Age modelling results for samples analysed in this study. Upper graphs show $\delta^{18}\text{O}$ (red) and $\delta^{13}\text{C}$ (blue) plotted on the Oxcal age model. Lower graphs show the U-Th ages with 2 sigma uncertainty used in the Oxcal age model (black circles with horizontal lines) plotted relative to distance along the growth axis. The dark grey line marks the central age model and the light grey lines mark the 2 sigma uncertainty. Pink lines show the growth rate.

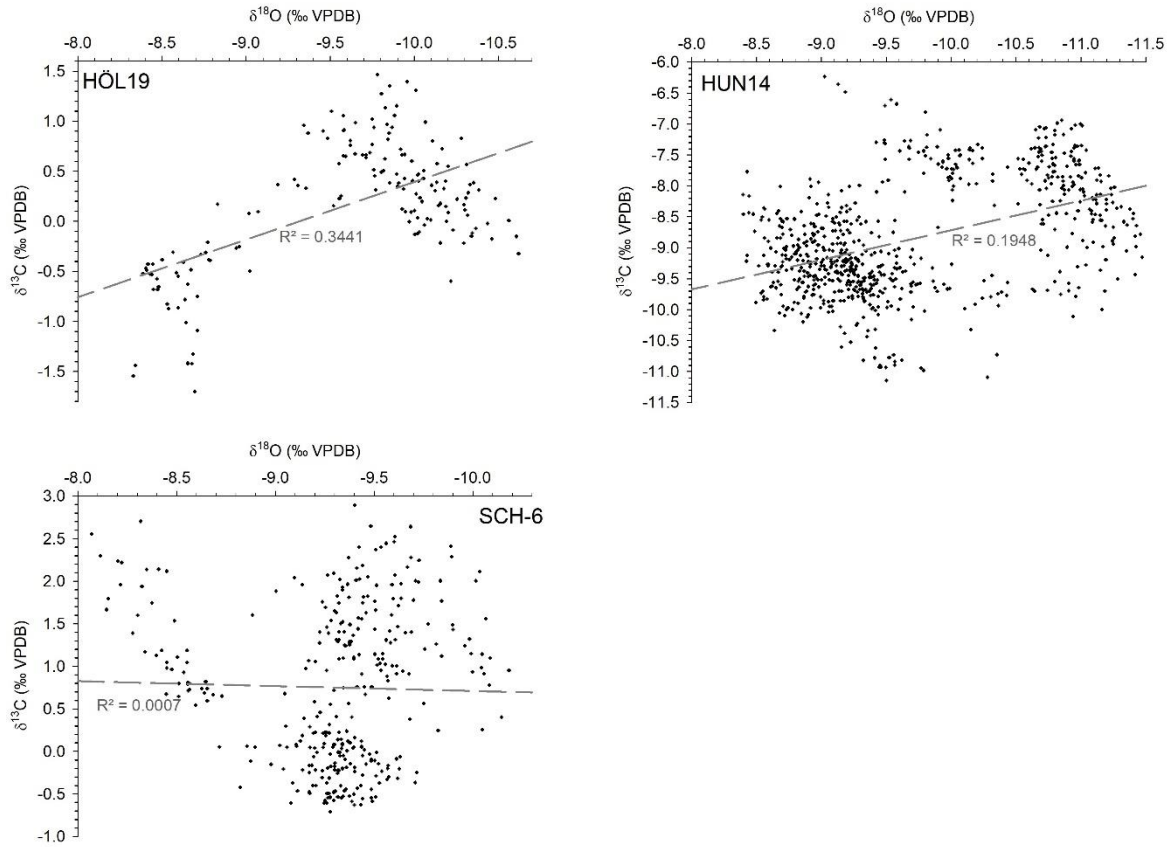

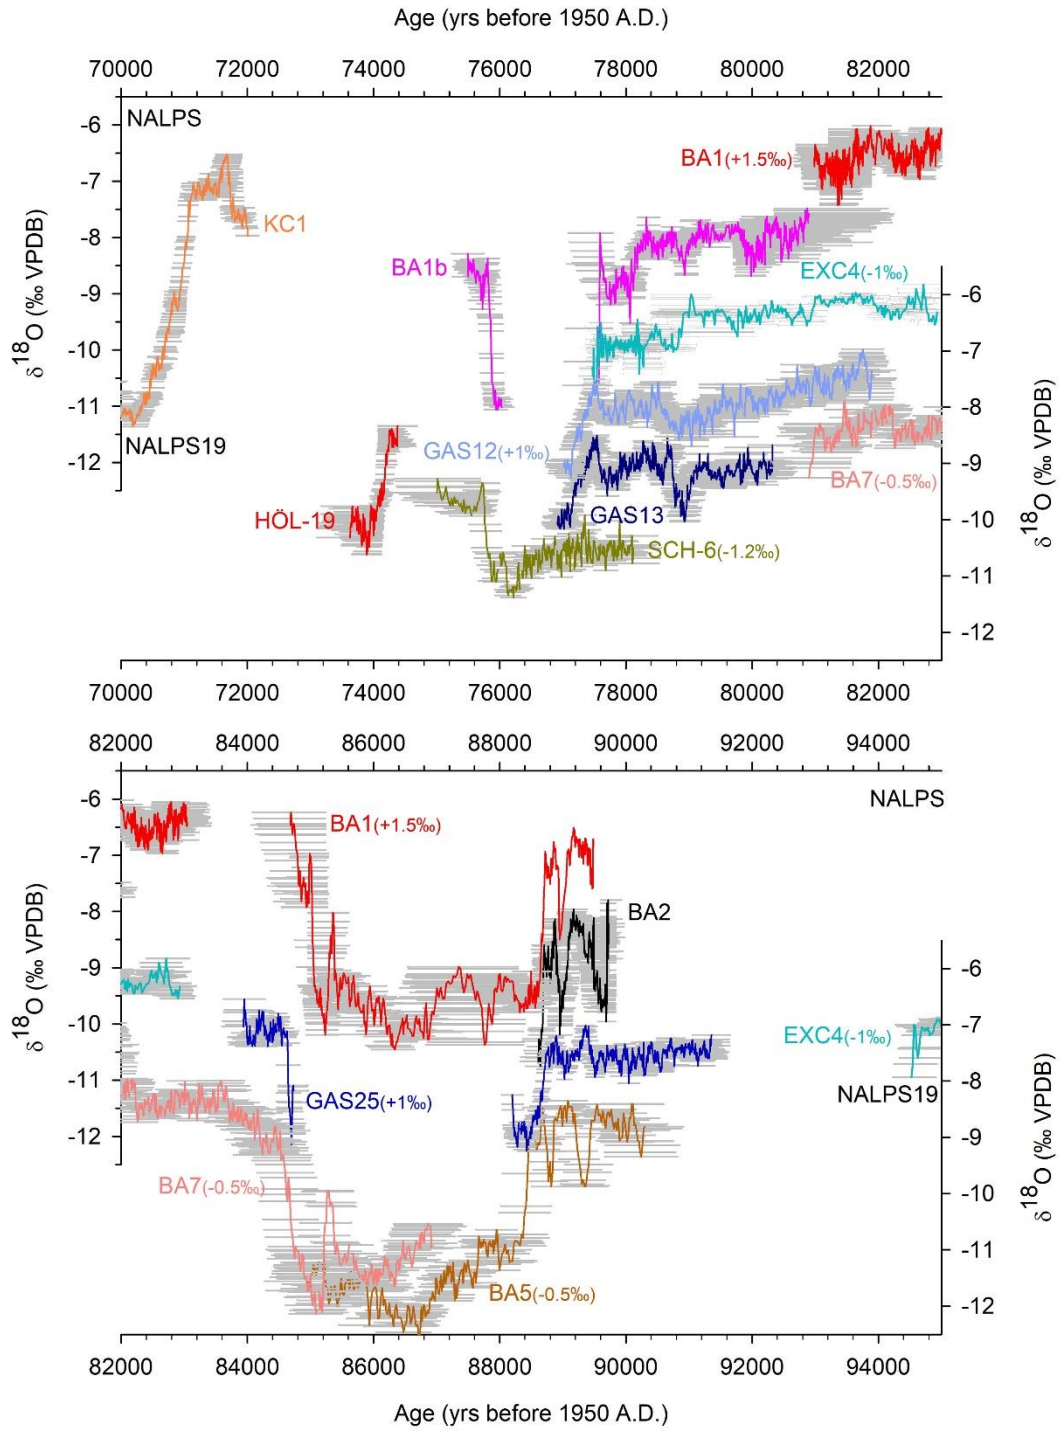

Figure S4: $\delta^{18}\text{O}$ versus $\delta^{13}\text{C}$ for each sample analysed in this study as well as the correlation coefficient (R^2).

Table S2: Results of Hendy tests for the samples analysed in this study.

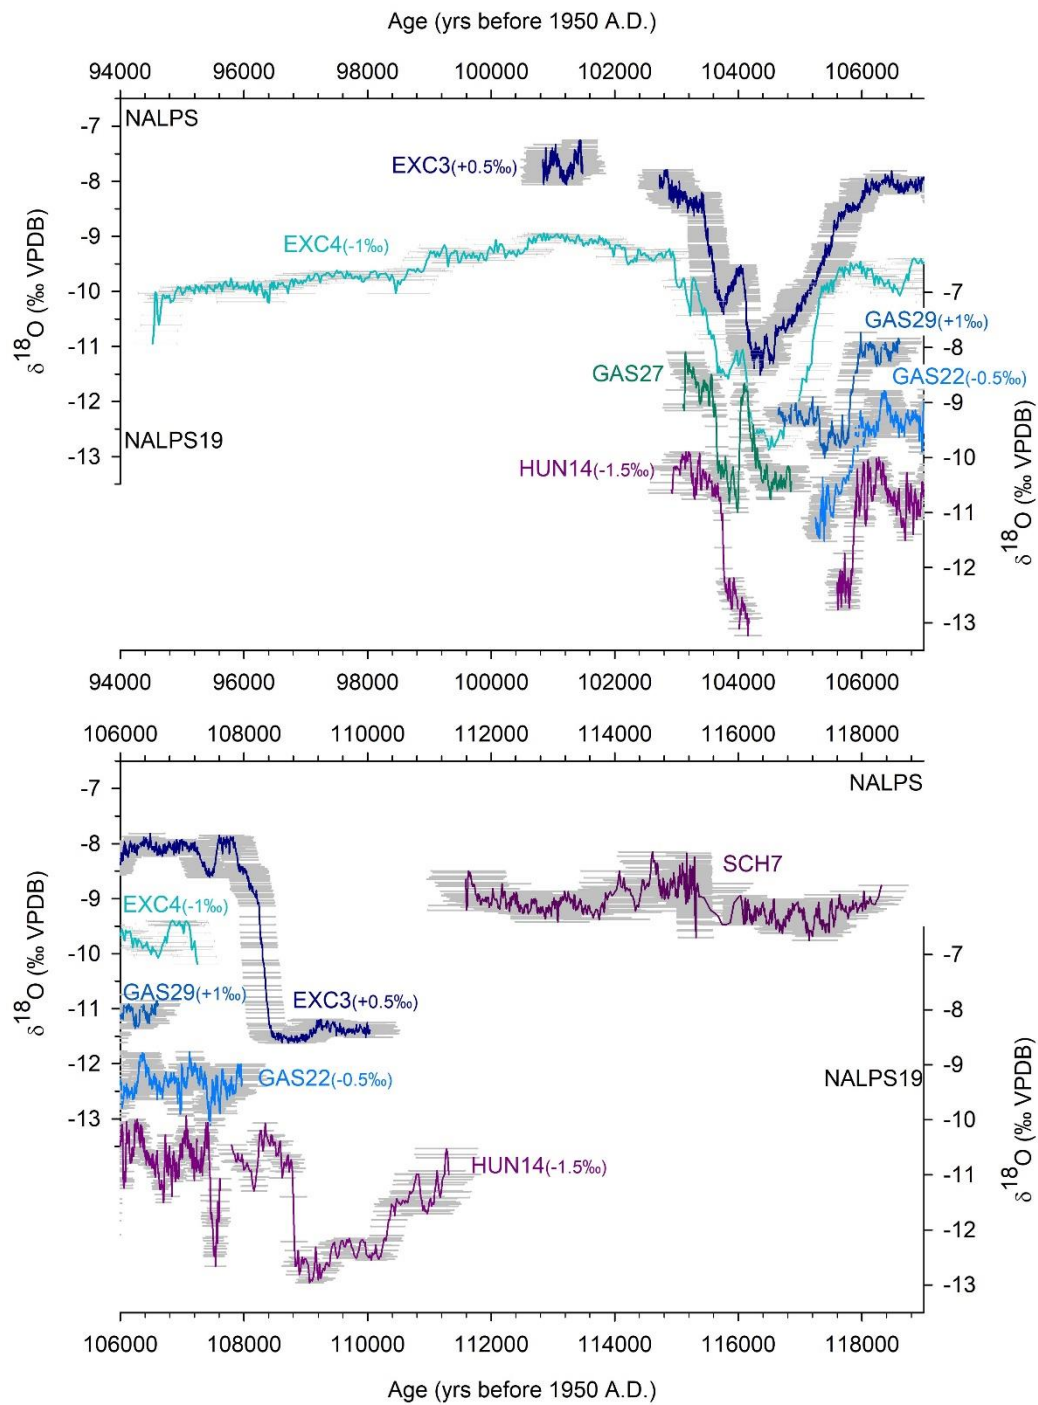

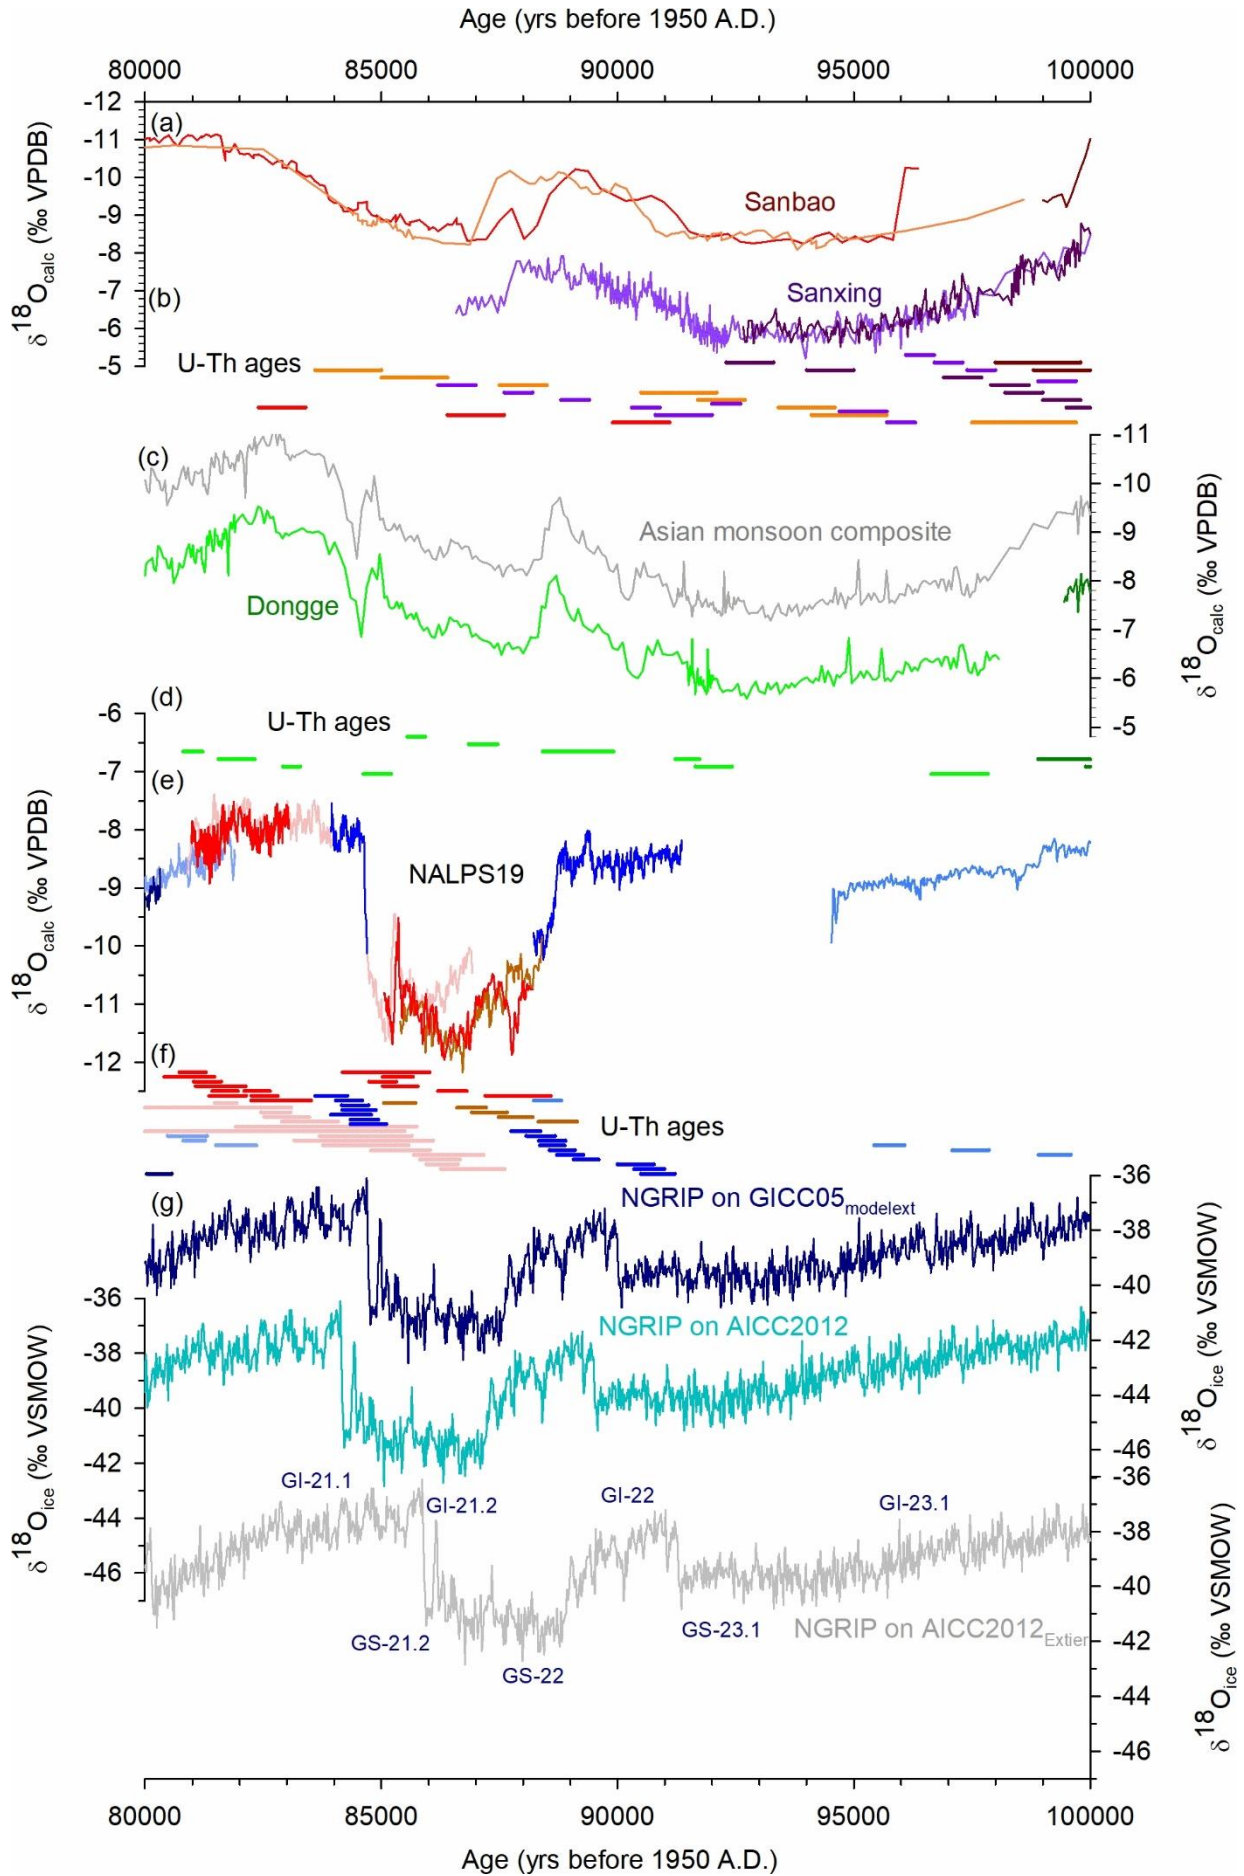

Figure S5: $\delta^{18}\text{O}$ records of NALPS19 (this study) versus NALPS11 (Boch et al., 2011) including 2σ uncertainty (grey horizontal bars). The records are shifted for ease of viewing; the direction and amount of shift are indicated in parentheses.

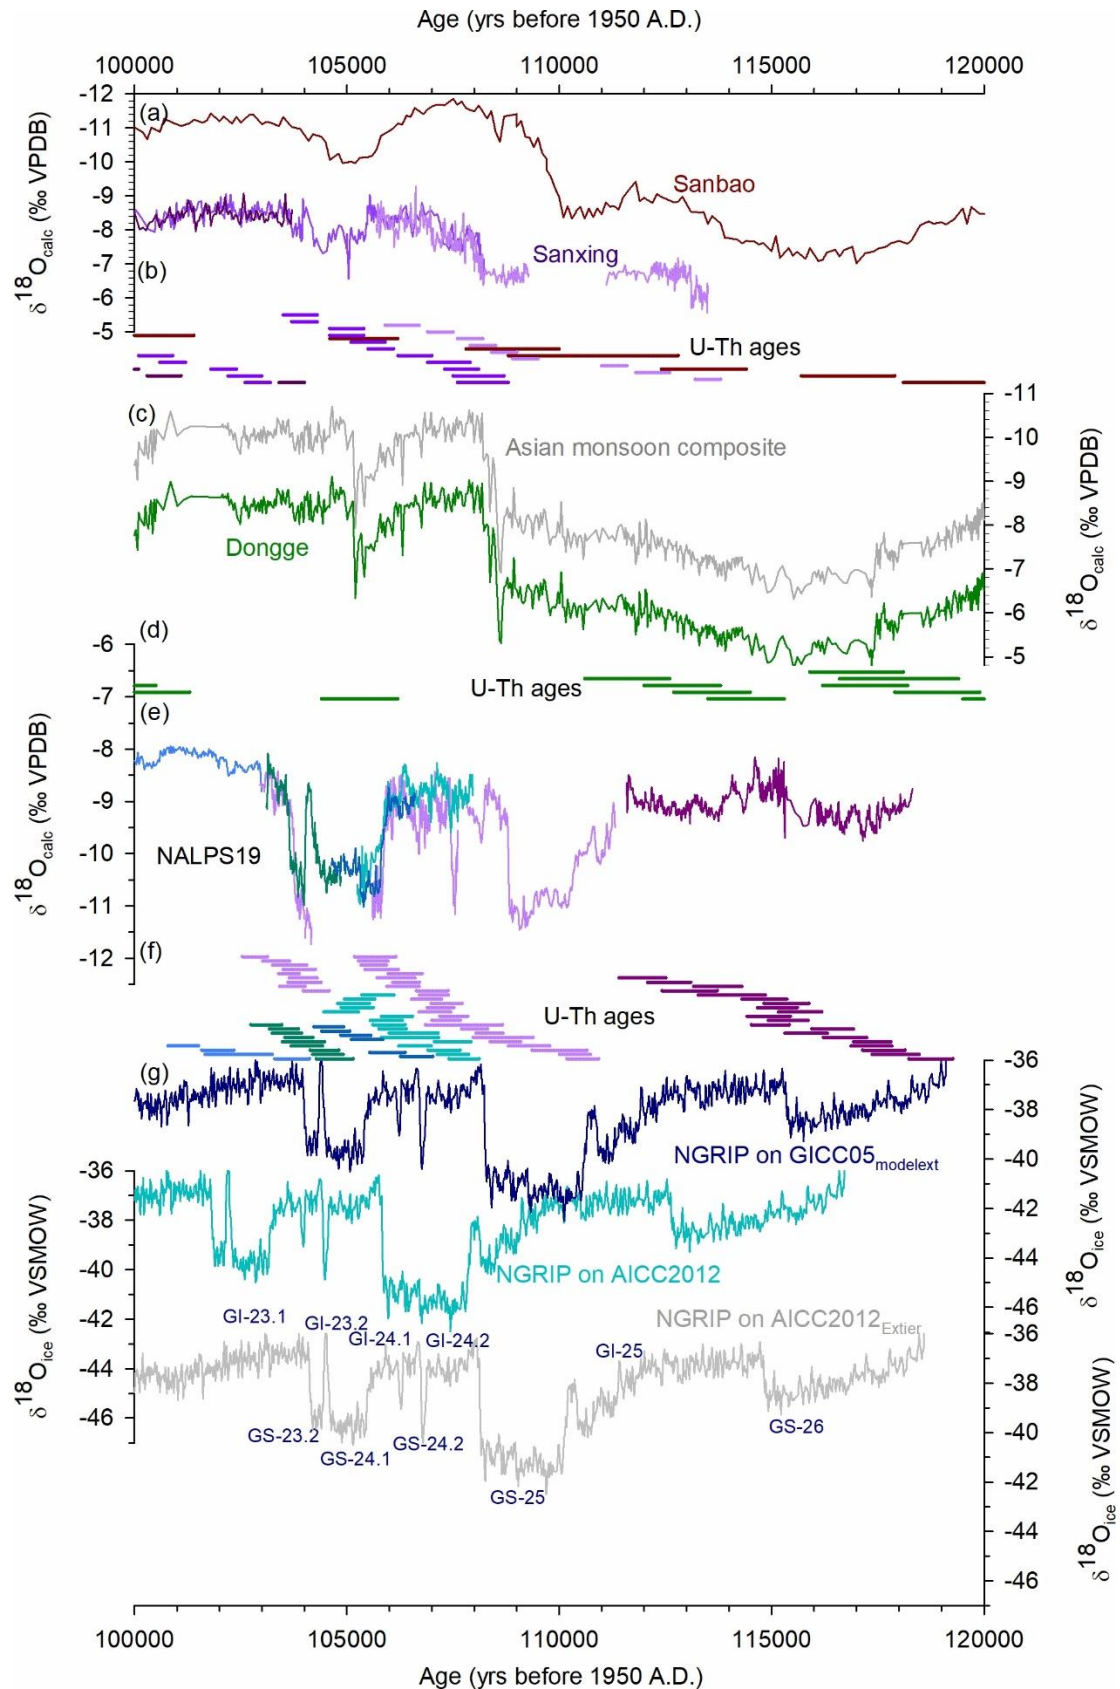

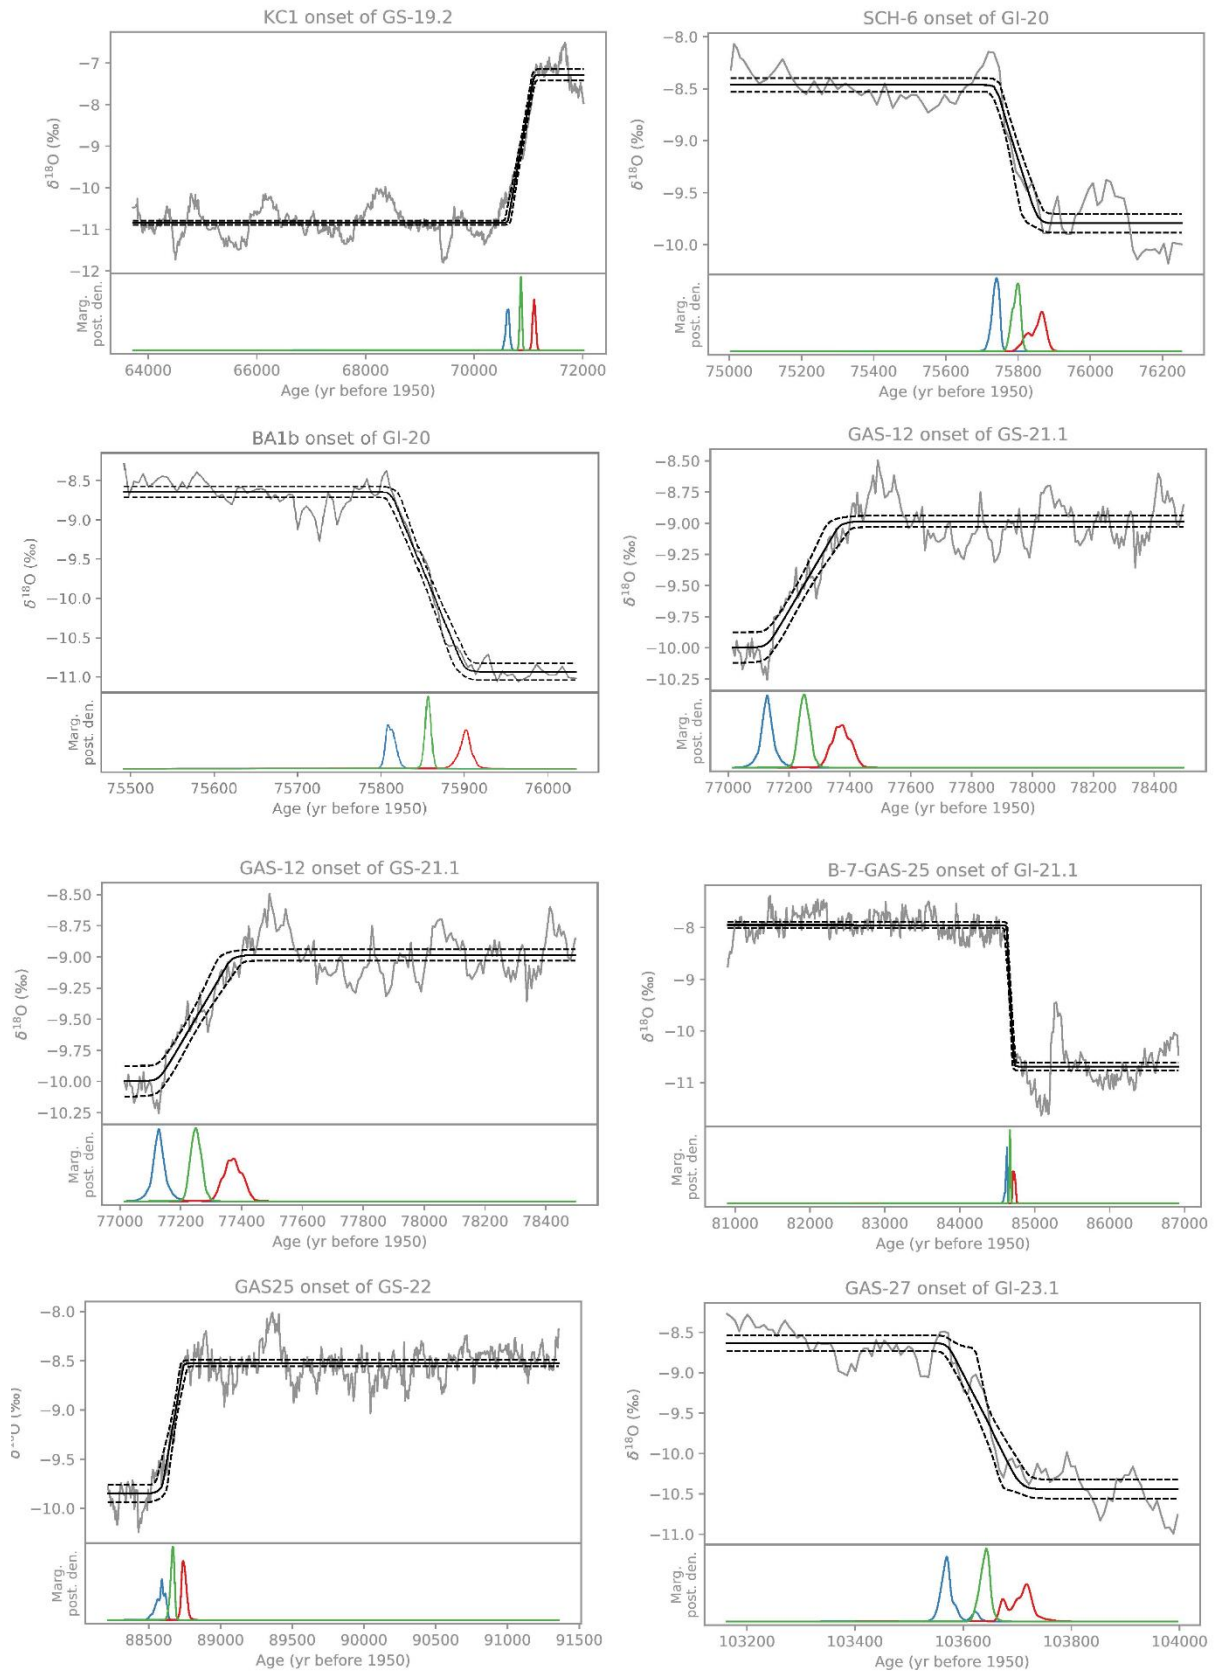

Figure S6: Fig. 3 from the main manuscript split into 20,000 year timeslices for ease of viewing. (a) Chinese speleothem $\delta^{18}\text{O}$ records from Sanbao (Wang et al., 2008) and Sanxing (Jiang et al., 2016). (b) 2σ range of U-Th ages for (a) colour-coded the same. (c) Asian monsoon composite record (Cheng et al., 2016) as well as the original data from which it is constructed (Dongge; Kelly et al., 2006; Kelly, 2010). (d) 2σ range, of U-Th ages for (c) colour-coded the same. (e) NALPS19 record (this study). (f) 2σ range of U-Th ages for (e) colour-coded the same. (g) NGRIP records on the GICC05_{modelext} chronology (Svensson et al., 2008; Wolff et al, 2010), AICC2012 chronology (Veres et al., 2013), and AICC2012 revised according to Extier et al. (2018).

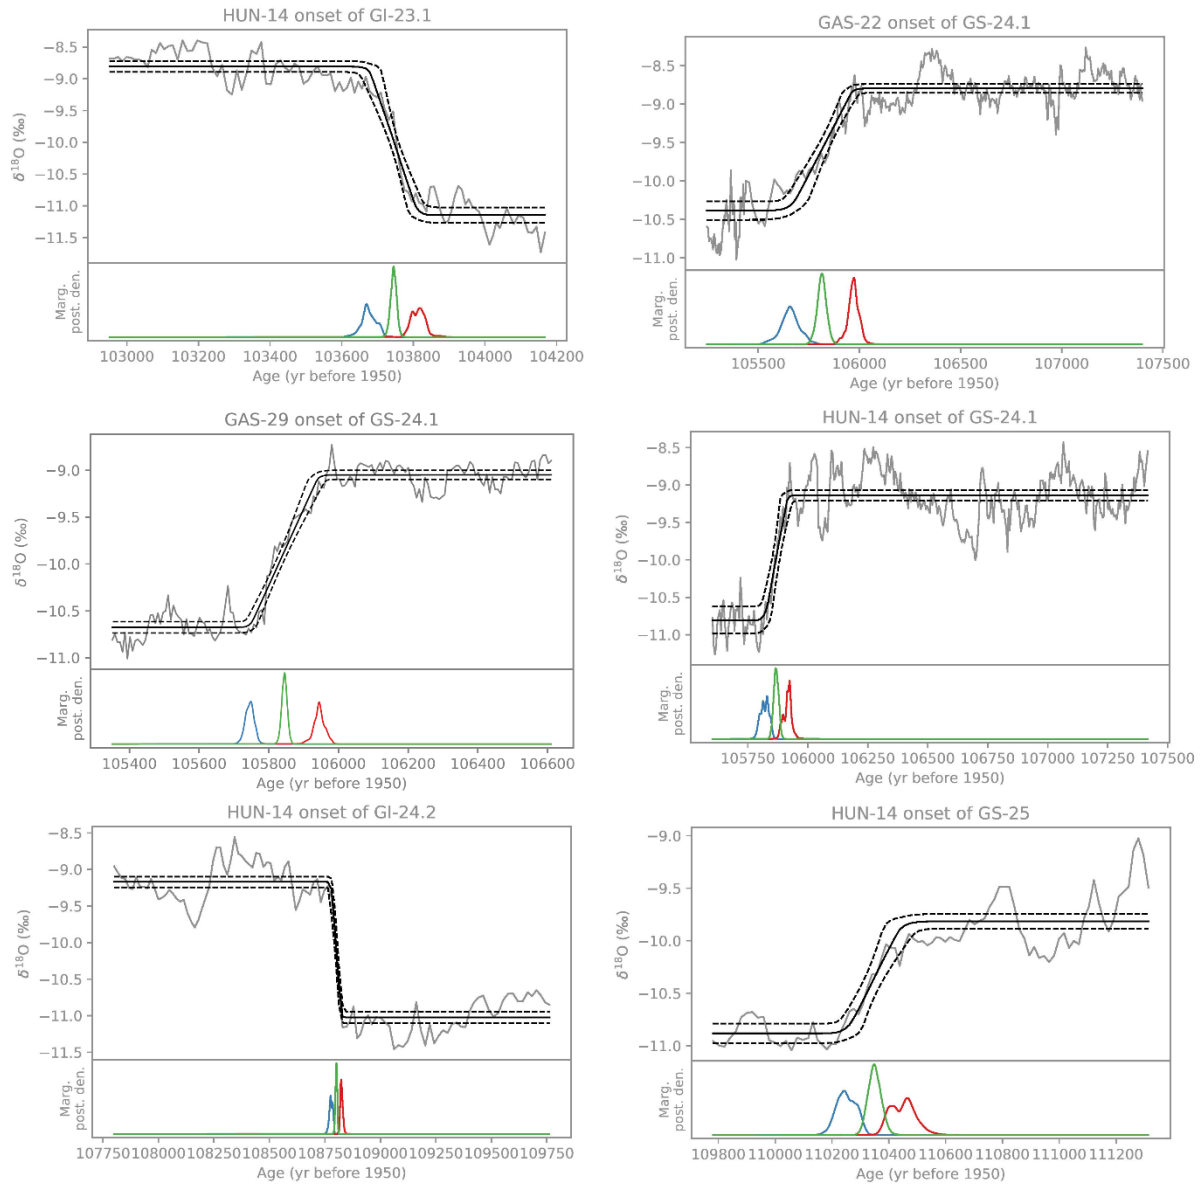

Figure S7: Fitting results of the Erhardt et al. (2019) algorithm for the NALPS19 (chronology from this study). Each of the top panels shows the fitted data together with marginal posterior median and 5th and 95th percentile of the fitted ramp in solid and dashed lines respectively. The bottom panels show the marginal posterior densities for the onset, midpoint and endpoint of the transitions (in red, green and blue).

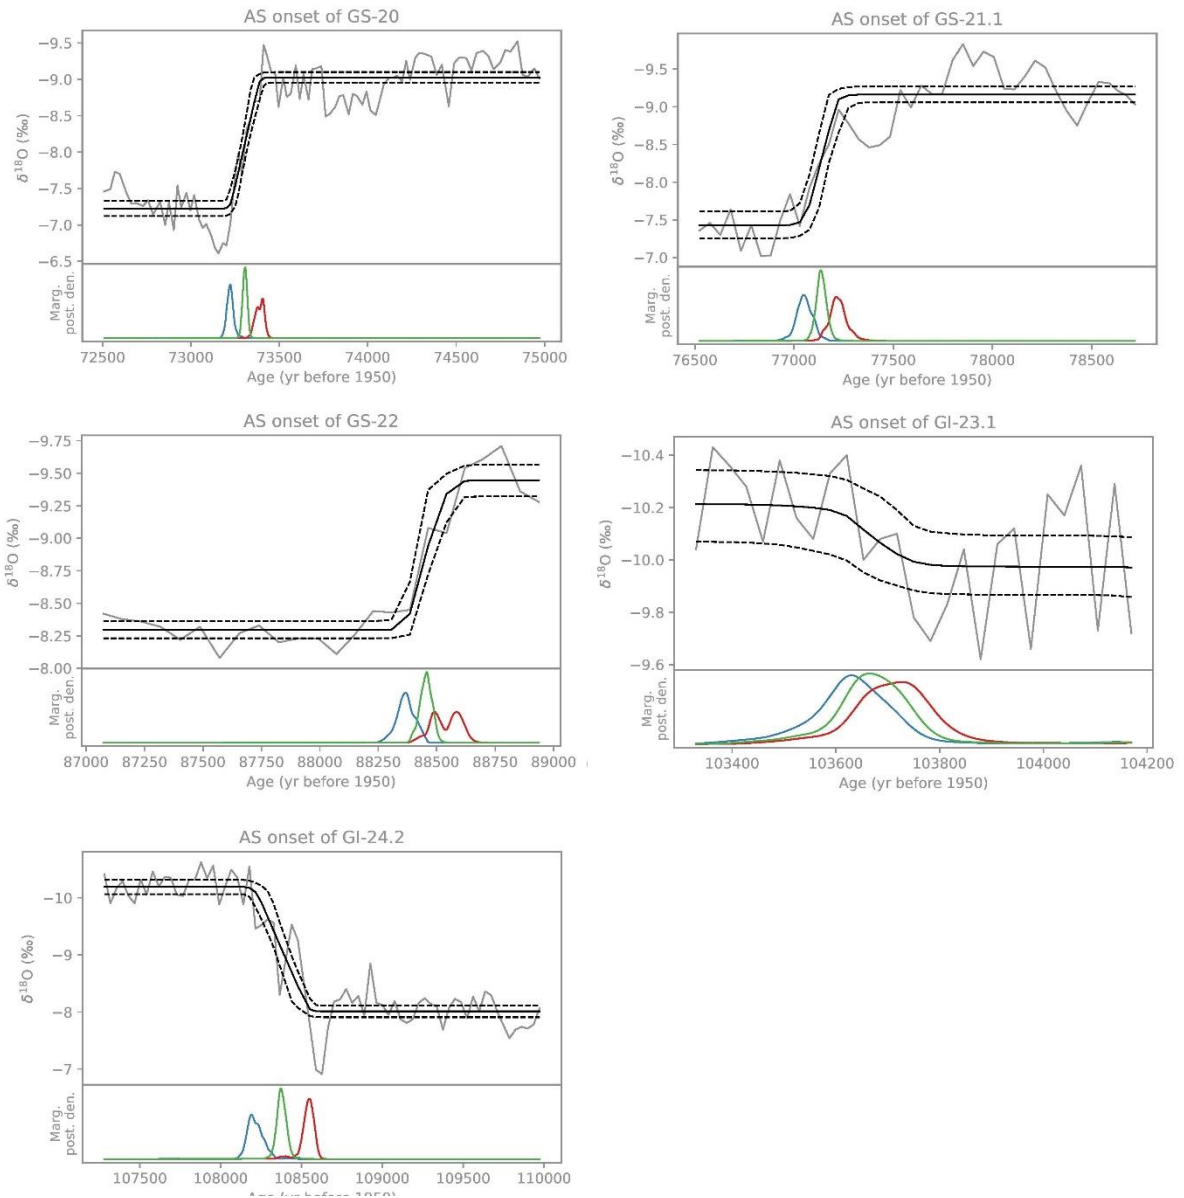

Figure S7: Fitting results of the Erhardt et al. (2019) algorithm for the Asian monsoon composite (Kelly et al., 2006; Kelly, 2010; Cheng et al., 2016). Each of the top panels shows the fitted data together with marginal posterior median and 5th and 95th percentile of the fitted ramp in solid and dashed lines respectively. The bottom panels show the marginal posterior densities for the onset, midpoint and endpoint of the transitions (in red, green and blue).

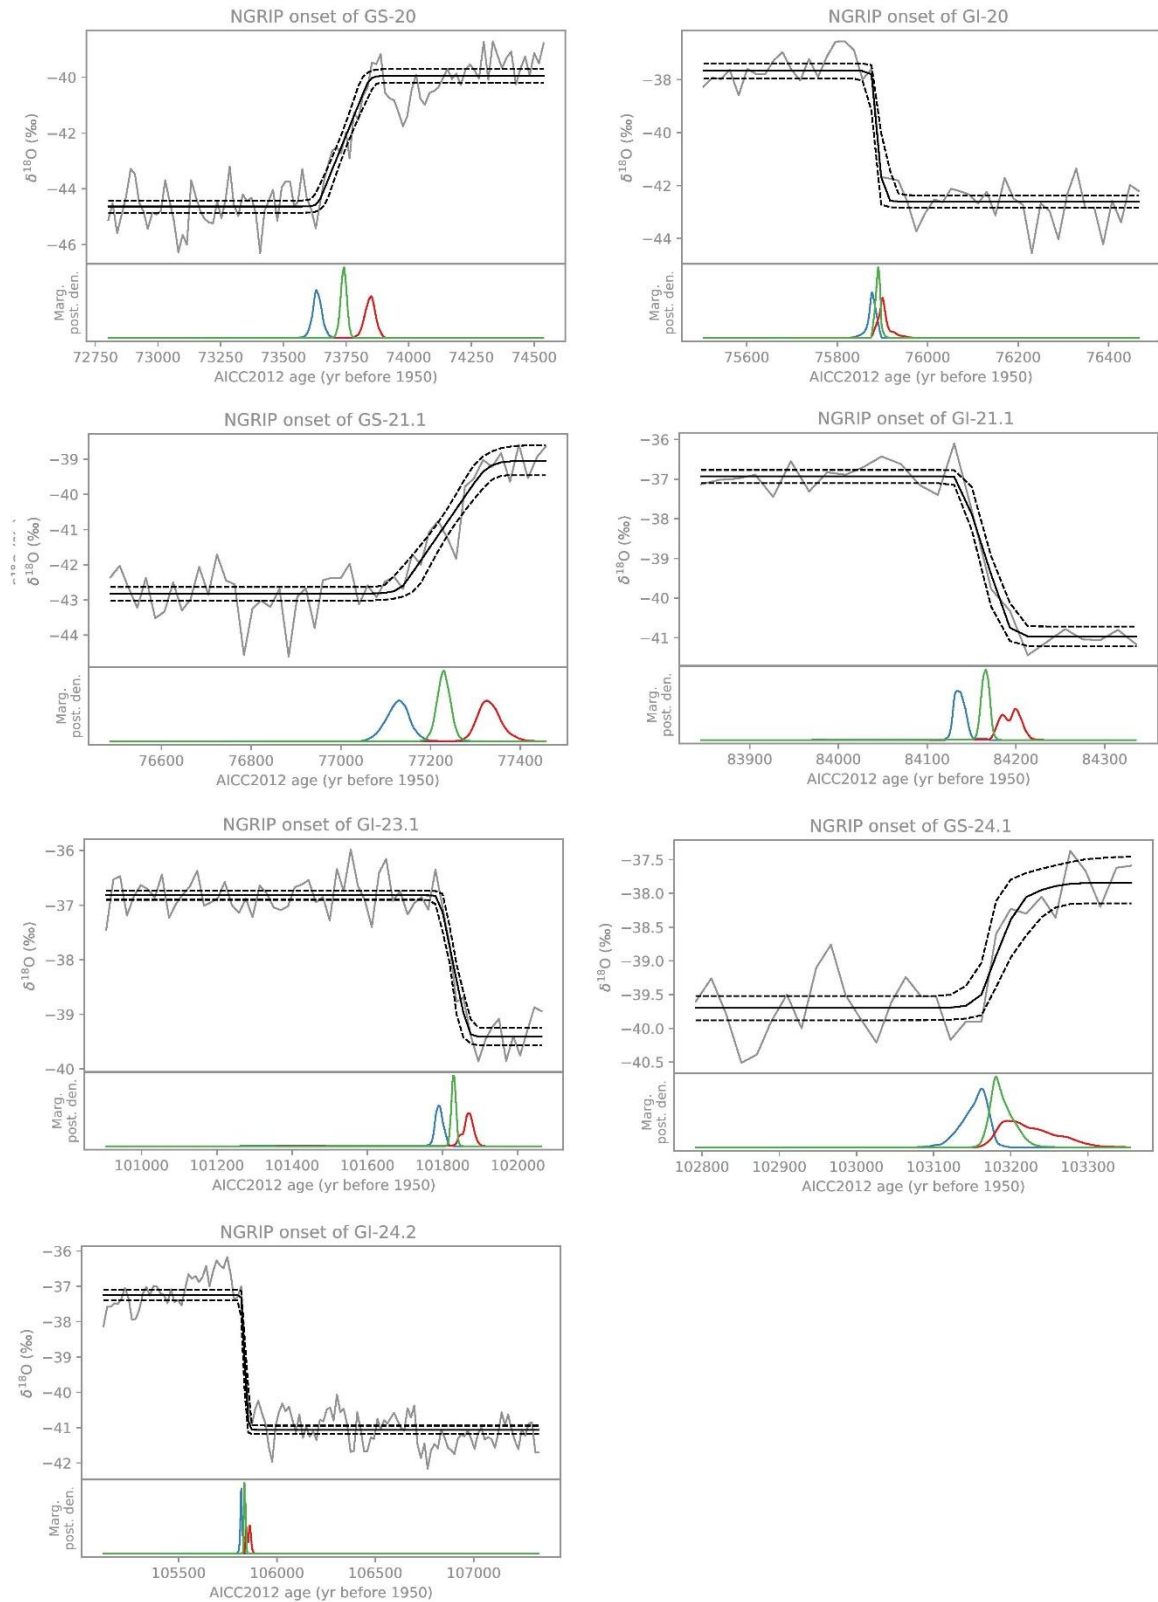

Figure S7: Fitting results of the Erhardt et al. (2019) algorithm for NGRIP on the AICC2012 chronology (Veres et al., 2013). Each of the top panels shows the fitted data together with marginal posterior median and 5th and 95th percentile of the fitted ramp in solid and dashed lines respectively. The bottom panels show the marginal posterior densities for the onset, midpoint and endpoint of the transitions (in red, green and blue).

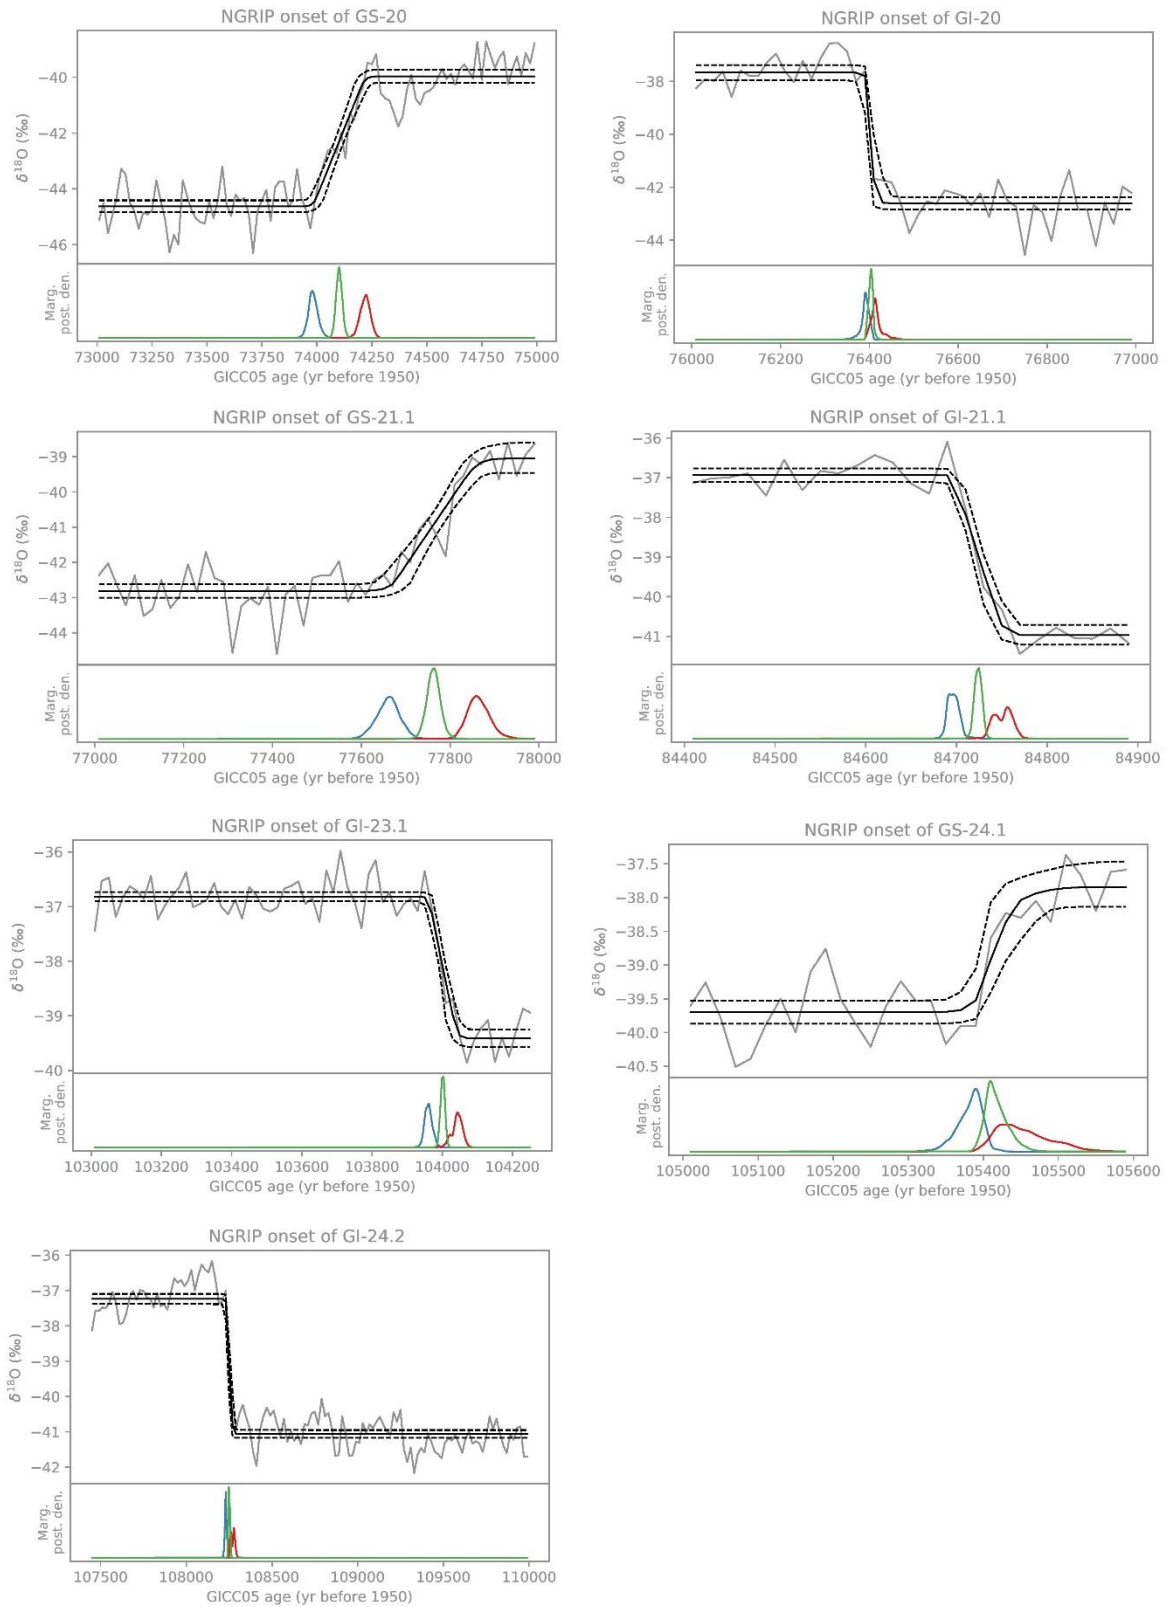

Figure S7: Fitting results of the Erhardt et al. (2019) algorithm for NGRIP on the GICC05modelext chronology (Wolff et al., 2010). Each of the top panels shows the fitted data together with marginal posterior median and 5th and 95th percentile of the fitted ramp in solid and dashed lines respectively. The bottom panels show the marginal posterior densities for the onset, midpoint and endpoint of the transitions (in red, green and blue).

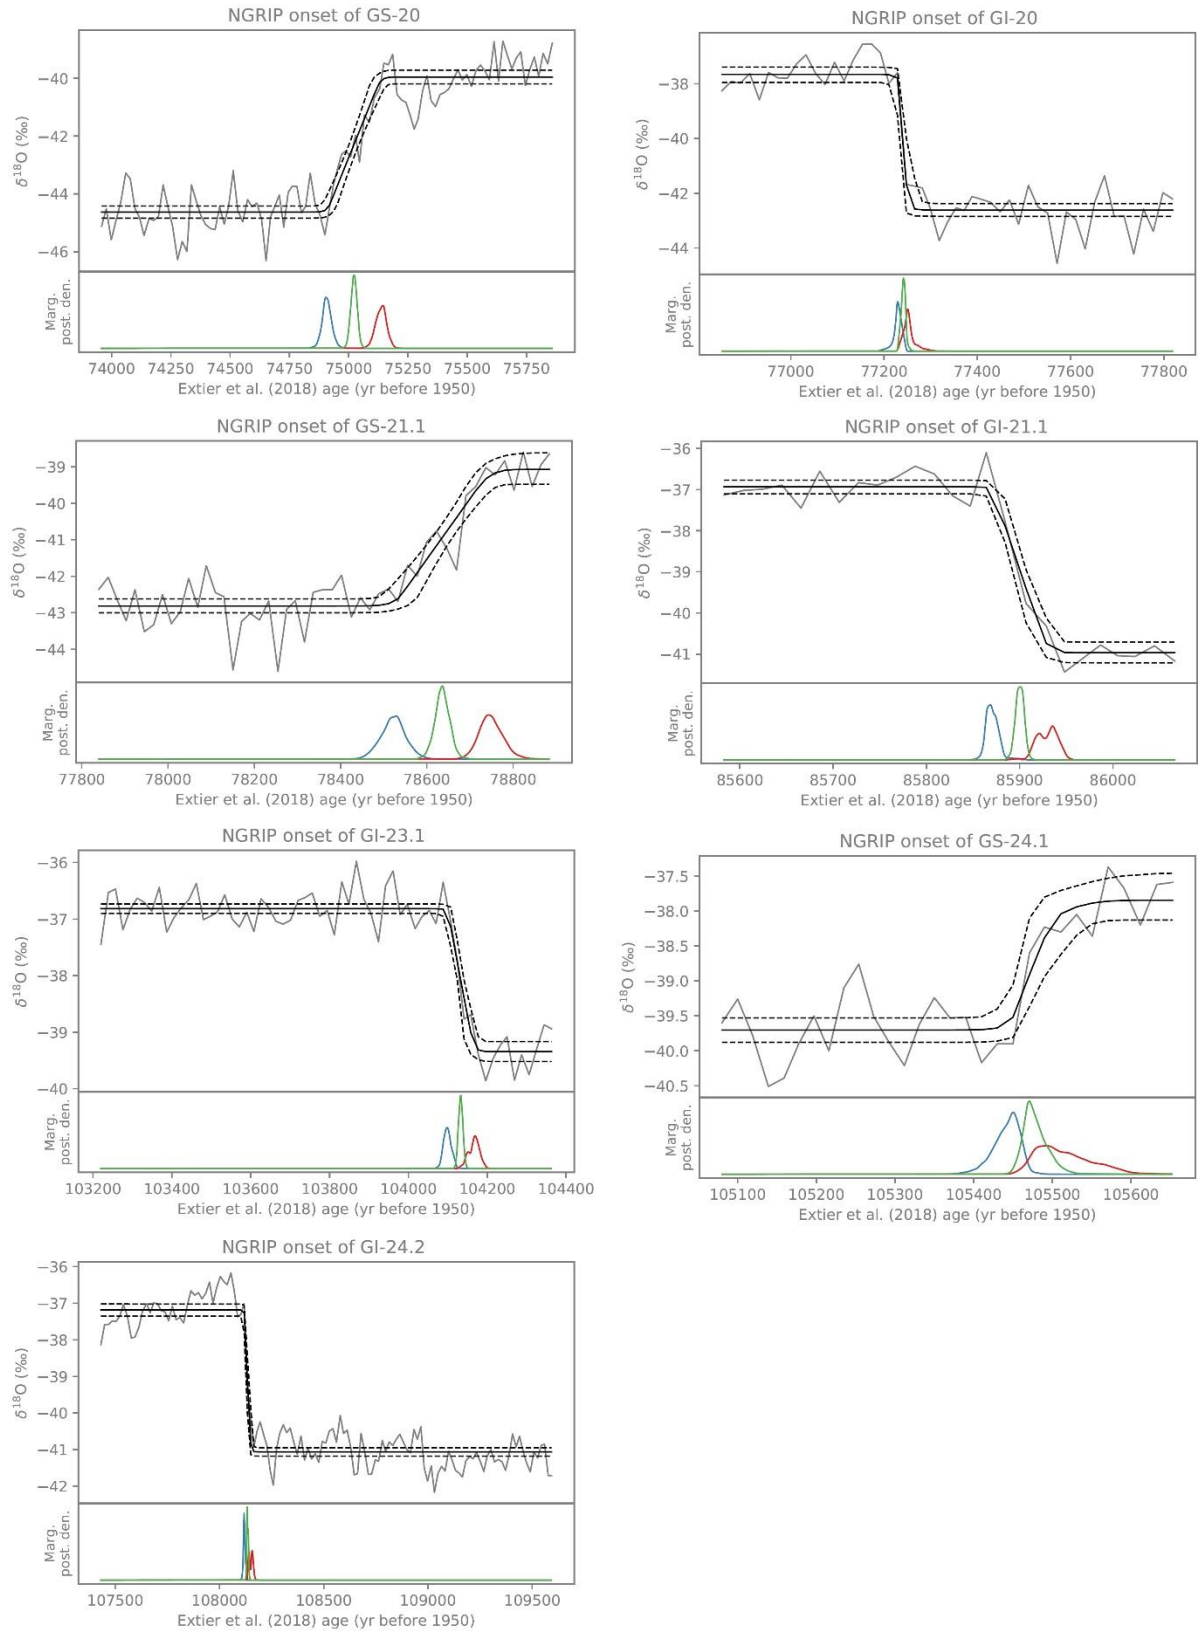

Figure S7: Fitting results of the Erhardt et al. (2019) algorithm for NGRIP on the Extier et al. (2018) revised AICC2012 chronology. Each of the top panels shows the fitted data together with marginal posterior median and 5th and 95th percentile of the fitted ramp in solid and dashed lines respectively. The bottom panels show the marginal posterior densities for the onset, midpoint and endpoint of the transitions (in red, green and blue).

Figure S8: Speleothem $\delta^{18}\text{O}$ records from the northern rim and central European Alps uncorrected for changes in mean $\delta^{18}\text{O}$ variability of seawater (grey). Light grey are single speleothems, dark grey are composite speleothem records. See Fig. 5 for details of the original data. Sections of the ice-volume-corrected $\delta^{18}\text{O}$ curve used to establish mean and median $\delta^{18}\text{O}$ values (black) presented in Table S3. Mean values (red horizontal bars).

Table S3: Mean and median $\delta^{18}\text{O}$ values for specific stadials and interstadials as shown in red horizontal bars (Fig. S8). *see Fig. S9

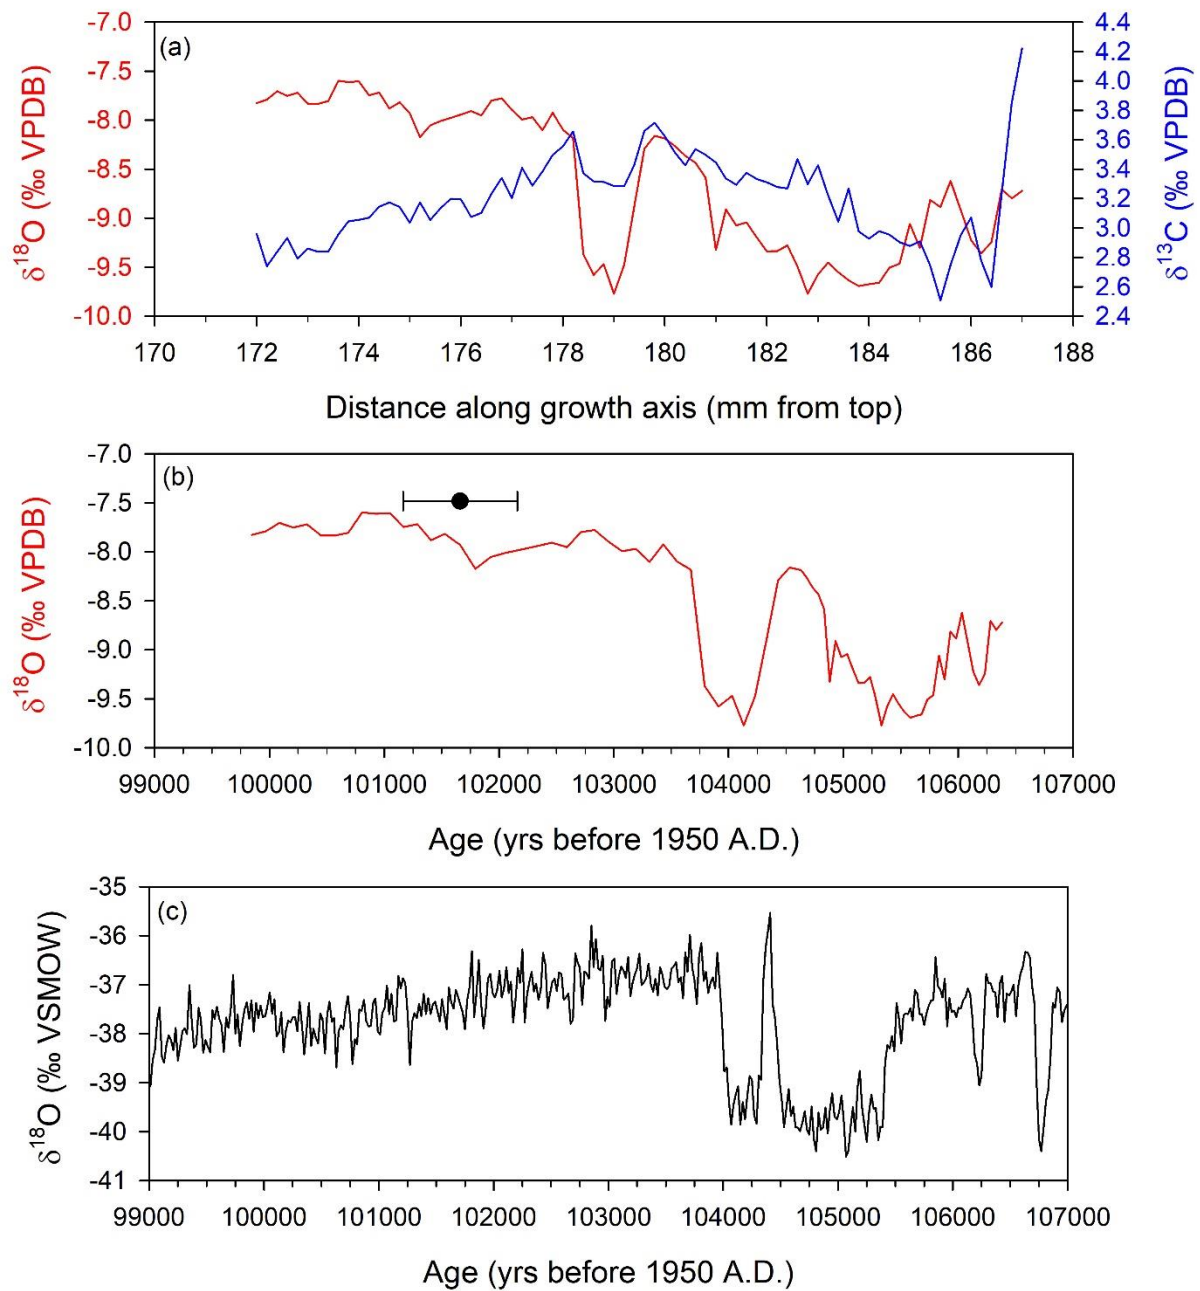

Figure S9: Preliminary data from Siebenhengste sample 7H12 provided by Marc Luetscher for this study. (a) Stable isotope data relative to distance along growth axis. (b) $\delta^{18}\text{O}$ on a preliminary age model. The U-Th age (black circle and 2 sigma uncertainty) firmly places the timing in GI-23.1. Since there are no hiatuses, the remainder is matched to a preliminary age model. The quality of the age model is not so important here because we are only interested in the mean $\delta^{18}\text{O}$ values for the respective stadials and interstadials. (c) NGRIP on GICC05modelext (Wolff et al., 2010).
