We appreciate and thank the constructive comments of Dr. Bourquin. We agree with most of the proposed improvements, and so, we will incorporate them in the revised version of the paper: (1) We will complete the sedimentological description and interpretation in order to give readers a better understanding of the studied sequence. With a deeper explanation the proposed Fig. 1D wouldn't be necessary, and (2) We will modify, as proposed by Dr. Bourquin, line 14 into the "Intermediate or Middle Unit" in order to avoid confusion with units names.
