Dear R. Rachmayani, both reviewer are very positive about your contribution. However, in particular reviewer 2 raises many specific issues that you need to consider to improve/to correct the presentation of your results. The reviewer also asks to provide a more in-depth discussion whether to what extent your results are model-type dependent. Before the background of this special issue that has a global view on the interglacial and before the background of the global monsoon hypothesis, it would be nice if you could add some sentences in the discussion whether your findings for the African Holocene monsoon can also be relevant for other monsoon areas and other

C1914

interglacials or whether you consider this a specific African/Holocene matter.

Best wishes Ulrike Herzsuh
