CONTROL2: > 1 chronological control in 2K

AGE500: 1 numerical age < 500 yr

Res200: 200yr minimum average sample interval.

MIN1500: Minimal age less than 1500 yr BP

DUR500: a minimum length of 500 yr

TOP-END: The timeline must be constrained by at least one chronological control point near the end (most recent) part of the record and another near the oldest part of the record. Sites which partially fulfil this criteria, lack of recent chronological control (<200 cal yrs BP).

1000_MID: When older than 1000 years, records must include at least one additional age nearly midway between the other two

2. Paleohydric pollen index construction of each record

3. Mallín Península Avellaneda Alto chronology, pollen and charcoal records analysis

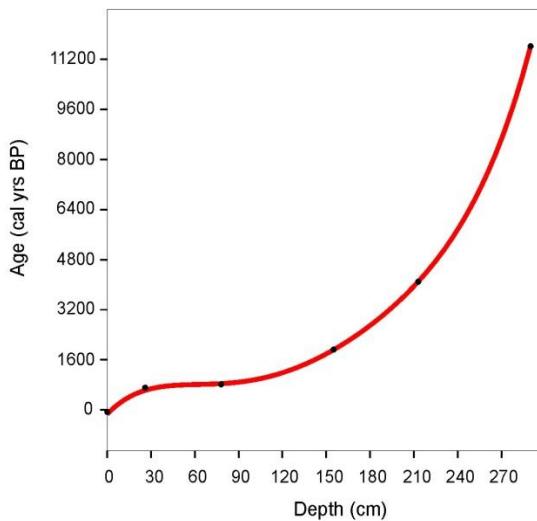

3.1. Radiocarbon dates from Mallín Península Avellaneda Alto

Radiocarbon dates were calibrated using the CALIB Rev 7.0.1 software (Stuiver et al., 2005). All radiocarbon dates were calibrated with the Southern Hemisphere curve (SHCal13) (Hogg et al., 2013). Material analyzed: bulk organic matter.

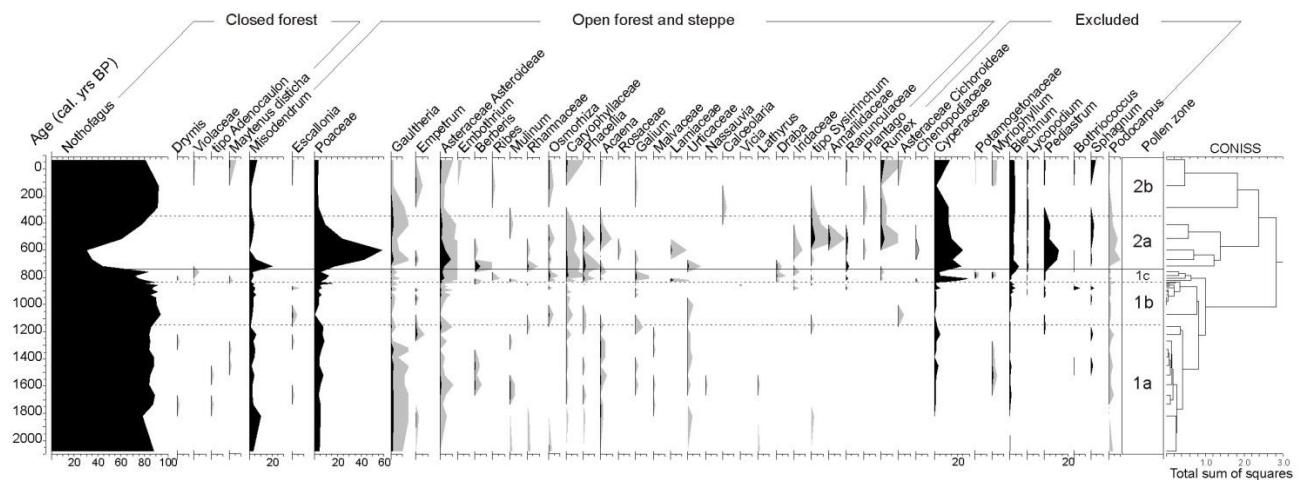

Sample depth (cm)	Age ^{14}C yr BP	Age cal yrs BP	Lab. Cod.
0-1	-	-60	n/a
26-27	835±44	711	AA99350
78-79	948±35	819	AA96517
155-156	2013±37	1928	AA96516
218-219	3782±40	4094	AA89352
291-292	10112±69	11613	UBA23299

3.2. Age-depth Model of Mallín Península Avellaneda Alto

An age-depth model based on five AMS radiocarbon dates and the assignment of a modern age (AD 2010) to the surface of the sequence was performed using PAST software (Hammer et al., 2001) applying a five degree polynomial function ($4.307 \times 10^{-08}(\text{depth})^5 - 2.994 \times 10^{-05}(\text{depth})^4 + 0.008215(\text{depth})^3 - 0.9424(\text{depth})^2 + 48.58(\text{depth}) - 60$).

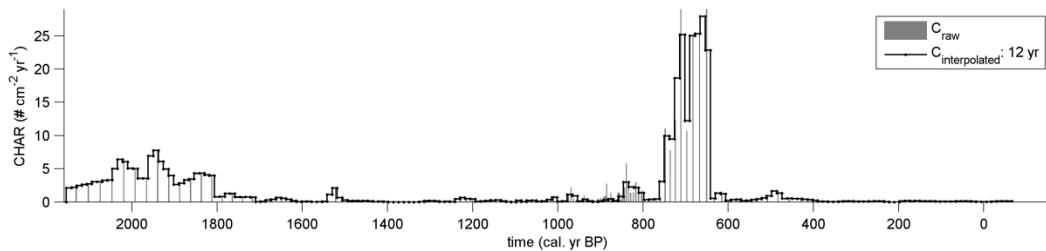

3.3. Mallín Península Avellaneda Alto pollen diagram (in percentages) and pollen zones obtained by cluster analysis.

Pollen Zone	Age (cal yrs BP)	Pollen characteristics
2b	Present-350	Re-establishment of <i>Nothofagus</i> , accompanied by a decrease in palynological richness, low presence of herbs and shrubs. Inferred vegetation: Closed forest with poorly developed understory vegetation.
2a	350-730	The <i>Nothofagus</i> values drops abruptly to 30-40%, with an increase of herbs and shrubs values. Poaceae reaches the highest values of the record (60%). Inferred vegetation: Open forests and grass steppe mosaic.
1c	730-830	<i>Nothofagus</i> slightly decrease favoring the development of some herbs and shrubs, such as: Asteraceae subf. Asteroideae, Caryophyllaceae, <i>Phacelia</i> and <i>Galium</i> . The major pick in Cyperaceae values took place in this zone. Inferred vegetation: Mixed of closed forest and forest gaps.
1b	830-1150	Rise of the <i>Nothofagus</i> values and a decrease of pollen richness. Inferred vegetation: Closed forest with poorly developed understory vegetation.
1a	1150-2150	Dominance of <i>Nothofagus</i> (up to 80%). Low values (<10%) of Poaceae, <i>Gaultheria</i> , Asteraceae subf. Asteroideae and other herbs. Inferred vegetation: Mixed of closed forest and forest gaps.

3.4. Charcoal accumulation rates of Mallín Península Avellaneda Alto

Charcoal particles > 250 μm and between 250 and 125 μm were summed together as they show the same patterns. Charcoal concentrations (number of particles/cm³) were multiplied by sedimentation rate (cm/yr) to obtain the charcoal accumulation rate (CHAR; particles/cm²/yr) of each sample. Charcoal data were interpolated to constant 12 years, corresponding approximately to the median temporal resolution of the record. All statistical treatments were done using the program CharAnalysis, written by Philip E. Higuera (<http://CharAnalysis.googlepages.com>).

4. Bajo de la Quinta and La tercera chronology

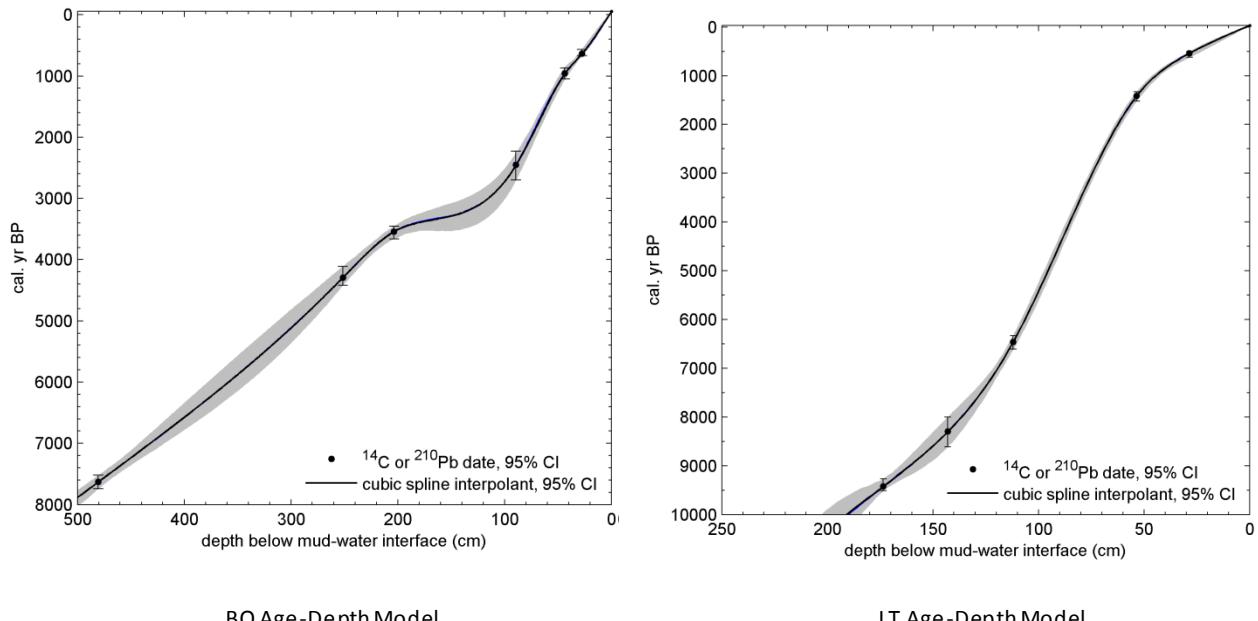

4.1. Radiocarbon dates from Bajo de la Quinta (BQ) and Mallín La Tercera (LT)

Radiocarbon dates were calibrated using the CALIB Rev 7.0.1 software (Stuiver et al., 2005). All radiocarbon dates were calibrated with the Southern Hemisphere curve (SHCal13) (Hogg et al., 2013). Material analyzed bulk organic matter.

	<i>Sample depth (cm)</i>	<i>Age ^{14}C yr BP</i>	<i>Age cal yr BP</i>	<i>Lab. Cod.</i>
<i>BQ</i>	0-1	-	-59	n/a
	27-28	721±24	637	D-AMS 008818
	43-44	1097±35	956	AA96518
	89-90	2422±68	2452	AA92539
	203-204	3358±37	3540	AA92540
	251-252	3909±50	4292	AA93730
	480-181	6821±58	7629	AA88053
<i>LT</i>	0-1	-	-35	n/a
	28-29	565±37	536	D-AMS 008819
	53-54	1570±37	1412	AA87093
	111-113	5717±45	6459	AA76035
	142-144	7540±160	8298	A4335
	173-174	8439±52	9424	AA87094

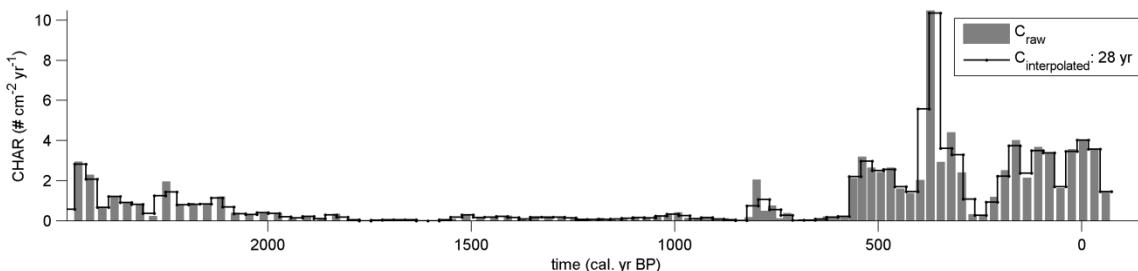

4.2. Age-depth Models of Bajo de la Quinta (BQ) and Mallín La Tercera (LT)

Age-depth models based on AMS radiocarbon dates were performed using MCAGe software (Higuera et al., 2009).

4.3. Charcoal accumulation rates of Bajo de la Quinta

Charcoal particles > 250 μm and between 250 and 125 μm were summed together as they show the same patterns. Charcoal concentrations (number of particles/cm³) were multiplied by sedimentation rate (cm/yr) to obtain the charcoal accumulation rate (CHAR; particles/cm²/yr) of each sample. Charcoal data were interpolated to constant 28 years, corresponding approximately to the median temporal resolution of the record.

Section 5. Pollen indicators classification of Local dataset records

Site Name: Mallín Península Avellaneda Alto

Vegetation description: This site is a highland peatbog (600 m a.s.l.) surrounded by closed *Nothofagus pumilio* forests. Understory vegetation is adapted to shaded condition dominated by rosette herbs such as *Adenocaulon* and *Viola*. Also, ferns and *Maytenus disticha* develop under shaded conditions. Farther east open vegetation dominates with *Poaceae*, hairy herbs and shrubs (*Mulinum*) cover open patches. Paleohydric pollen index for this site reflects changes in canopy closure. We assume that during periods of above (below) hydric balance, closed (open) canopy patches would develop at the record surrounding areas.

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species or species distribution
Adenocaulon type	<i>Adenocaulon chilense</i>	Positive	Mesophytic rosette herb	Sottile et al., 2015
<i>Nothofagus</i>	<i>Nothofagus pumilio</i>	Positive	Mesophytic tree	Donoso, 2006
Drymis	<i>Drymis winteri</i>	Positive	Shade tolerant Mesophytic tree	Donoso, 2006
<i>Maytenus disticha</i>	<i>Maytenus disticha</i>	Positive	Shade tolerant dwarf shrub	Sottile et al., 2015
<i>Viola</i>	<i>Viola</i> spp.	Positive	Shade tolerant herb	Sottile et al., 2015
<i>Misodendrum</i>	<i>Misodendrum</i> spp.	Negative	Parasitic- open canopy	Peri & Ormaechea, 2013. Moreno et al., 2014.
Acaena	Mostly <i>Acaena magellanica</i> , <i>Acaena splendens</i> , <i>Acaena poeppigiana</i> , <i>Acaena pinnatifida</i>	Negative	Hairy herbs	Sottile et al., 2015
Apiaceae	<i>Bolax</i> sp.	Negative	Dwarf shrub	Correa MN (1969-1999)
Asteraceae subf. Asterodeae	<i>Senecio</i> spp. <i>Gamochaeta</i> spp.	Negative	Hairy shrubs and herbs	Sottile et al., 2015
Asteraceae tribe Mutisieae	<i>Perezia</i> spp. <i>Leucheria</i> spp.	Negative	Sclerophilous and hairy herbs	Sottile et al., 2015, Correa MN (1969-1999)
Berberis	<i>Berberis microphylla</i>	Negative	Sclerophilous shrub	Sottile et al., 2015
Calceolaria	<i>Calceolaria</i>	Negative	Heliophilous herbs	Correa MN (1969-1999)

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
Caryophyllaceae	<i>Cerastium arvense</i> <i>Stellaria nemorum</i>	Negative	Heliophilous hairy herbs	Sottile et al., 2015
Chenopodiaceae	<i>Chenopodium</i> sp.	Negative	Sclerophilous herb	Correa MN (1969-1999)
Draba	Draba sp.	Negative	Heliophilous herb	Boelcke et al., 1985 Correa MN (1969-1999)
Embothrium	<i>Embothrium coccineum</i>	Negative	Heliophilous tree	Donoso, 2006
Empetrum	<i>Empetrum rubrum</i>	Negative	Dwarf shrub	Sottile et al., 2015
Escallonia	<i>Escallonia rubra</i> <i>Escallonia virgata</i>	Negative	Mesophytic heliophilous shrub	Sottile et al., 2015 Pisano & Dimitri, 1973.
Galium	<i>Galium</i> spp.	Negative	Heliophilous herb-vine	Sottile et al., 2015 Pisano & Dimitri, 1973.
Gaultheria	<i>Gaultheria mucronata</i>	Negative	Sclerophilous shrub	Sottile et al., 2015
Iridaceae	<i>Sisyrinchium</i> sp. <i>Solenomelus</i> sp.	Negative	Helio- erectophilous herbs	Sottile et al., 2015 Boelcke et al., 1985 Correa MN (1969-1999)
Lamiaceae	<i>Scutellaria nummulariifolia</i>	Negative	Heliophilous herb	Boelcke et al., 1985 Correa MN (1969-1999)
Lathyrus type	<i>Lathyrus</i> sp.	Negative	Heliophilous hairy herb	Sottile et al., 2015
Malvaceae	<i>Lecanophora subacaule</i>	Negative	Hairy herb	Boelcke et al., 1985 Correa MN (1969-1999)
Mulinum	<i>Mulinum</i> spp.	Negative	Sclerophilous shrub	Sottile et al., 2015
Nassauvia type	<i>Nassauvia</i> spp.	Negative	Sclerophilous herb	Boelcke et al., 1985 Correa MN (1969-1999)
Phacelia	<i>Phacelia nana</i>	Negative	Hairy herb	Sottile et al., 2015
Osmorhiza type	<i>Osmorhiza chilensis</i>	Negative	Mesophytic herb	Sottile et al., 2015 Boelcke et al., 1985 Correa MN (1969-1999)
Plantago	<i>Plantago uniglumis</i> <i>Plantago sempervireoides</i>	Negative	Sclerophilous herb and dwarf shrub	Boelcke et al., 1985 Correa MN (1969-1999)

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
Poaceae	<i>Festuca</i> spp. <i>Poa</i> spp.	Negative	Helio-erectophilous herbs	Sottile et al., 2015 Boelcke et al., 1985 Correa MN (1969-1999)
Rhamnaceae	<i>Discaria chacaye</i>	Negative	Slerophilous shrub	Sottile et al., 2015 Boelcke et al., 1985 Correa MN (1969-1999)
Ribes	<i>Ribes</i> spp.	Negative	Heliophylous shrub	Sottile et al., 2015 Boelcke et al., 1985 Correa MN (1969-1999)
Rosaceae	<i>Geum magellanicum</i>	Negative	Heliosclerophilous shrub	Boelcke et al., 1985 Correa MN (1969-1999)
Sisyrinchium	<i>Sisyrinchium</i> spp.	Negative	Helio-erectophilous herb	Sottile et al., 2015
Urticaceae	<i>Urtica magellanica</i>	Negative	Hairy herb	Boelcke et al., 1985 Correa MN (1969-1999)

Site Name: Mallín Península Avellaneda Bajo

Vegetation description: this is a lowland peatbog (215 m a.s.l.) surrounded by patches of mixed *Nothofagus pumilio* and *Nothofagus antarctica* forests and open shrub-grass patches dominated by *Mulinum spinosum*, *Poa* spp. and *Festuca* spp. Other sclerophilous and heliophilous shrubs and herbs such as *Berberis buxifolia*, *Empetrum rubrum*, *Cerastium arvense*, *Lathyrus magellanicus* also develop in open canopy patches. Paleohydric pollen index for this site reflects changes in forest patches versus steppe patches abundance around the record area. We assume that during periods of above (below) hydric balance, forest (shrub-grass steppe) patches would develop at the record's surrounding areas.

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
Drymis	<i>Drymis winteri</i>	Positive	Forest patches	Donoso, 2006
Misodendrum	<i>Misodendrum</i> spp.	Positive	Parasitic of N. Antarctica and N. <i>pumilio</i>	Peri & Ormaechea, 2013. Moreno et al., 2014.
Nothofagus	<i>Nothofagus pumilio</i>	Positive	Forest patches	Donoso, 2006
Acaena	Mostly <i>Acaena magellanica</i> , <i>Acaena splendens</i> , <i>Acaena poeppigiana</i> , <i>Acaena pinnatifida</i>	Negative	Shrub-grass patches	Sottile et al., 2015
Amaranthaceae	<i>Nitrophila australis</i>	Negative	Shrub-grass patches	Correa MN (1969-1999)
Asteraceae subf. Asterodeae	<i>Senecio</i> spp. <i>Gamochaeta</i> spp.	Negative	Shrub-grass patches	Sottile et al., 2015
Asteraceae tribe Mutisieae	<i>Perezia</i> spp. <i>Leucheria</i> spp.	Negative	Shrub-grass patches	Sottile et al., 2015, Correa MN (1969-1999)
Berberis	<i>Berberis microphylla</i>	Negative	Shrub-grass patches	Sottile et al., 2015
Calceolaria	<i>Calceolaria</i>	Negative	Shrub-grass patches	Correa MN (1969-1999)
Calyceraceae	<i>Boopis filifolia</i> <i>Gamocarpha selliana</i>	Negative	Shrub-grass patches	Correa MN (1969-1999)

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
Caryophyllaceae	<i>Cerastium arvense</i> <i>Stellaria nemorum</i>	Negative	Shrub-grass patches	Sottile et al., 2015
Chenopodiaceae	<i>Chenopodium</i> sp.	Negative	Shrub-grass patches	Correa MN (1969-1999)
Embothrium	<i>Embothrium coccineum</i>	Negative	Shrub-grass patches	Donoso, 2006
Empetrum	<i>Empetrum rubrum</i>	Negative	Shrub-grass patches	Sottile et al., 2015
Euphorbiaceae	<i>Euphorbia</i> sp.	Negative	Shrub-grass patches	Correa MN (1969-1999)
Fabaceae	<i>Lathyrus</i> sp. <i>Vicia</i> sp.	Negative	Shrub-grass patches	Sottile et al., 2015
Gaultheria	<i>Gaultheria mucronata</i>	Negative	Shrub-grass patches	Sottile et al., 2015
Iridaceae	<i>Sisyrinchium</i> sp. <i>Solenomelus</i> sp.	Negative	Shrub-grass patches	Sottile et al., 2015 Boelcke et al., 1985; Correa MN (1969-1999)
Lamiaceae	<i>Scutellaria nummulariifolia</i>	Negative	Shrub-grass patches	Boelcke et al., 1985 ; Correa MN (1969-1999)
Liliaceae	<i>Tristagma patagonicum</i>	Negative	Shrub-grass patches	Boelcke et al., 1985 ; Correa MN (1969-1999)
Mulinum	<i>Mulinum</i> spp.	Negative	Shrub-grass patches	Sottile et al., 2015

Poaceae	<i>Poa</i> spp. <i>Festuca</i> spp.	Negative	Shrub-grass patches	Boelcke et al., 1985; Correa MN (1969-1999)
Ranunculus	<i>Anemone multifida</i>	Negative	Shrub-grass patches	Sottile et al., 2015
Solanaceae	<i>Solanum</i> sp.	Negative	Shrub-grass patches	Correa MN (1969-1999)

Site Name: Mallín Paisano Desconocido

Vegetation description:

The core Mallín Paisano Desconocido (48° 58' S; 72° 14' W; Fig. 1) was obtained from the northeastern shore of Lago San Martín from the peat-bog located in a small canyon. *Nothofagus antartica* patches and grass steppe mosaic covers the eastern península Chacabuco (1 km to the east of Mallín Paisano Desconocido). The grass steppe area surrounding the peat bog is covered by *Festuca pallescens* and *Festuca argentina*. A shrub steppe, associated to rocky slopes, under lower water availability, is dominated by *Nardophyllum obtusifolium* associated with *F. pallescens* and high proportion of *Berberis*, *Senecio*, *Baccharis*, *Mulinum*, *Azorella* and *Schinus*. . Paleohydric pollen index for this site reflects changes in steppe communities between more mesic grass, herbs or shrub species versus more sclerophilous/ xerophytic shrub species abundance around the record area. We assume that during periods of above (below) hydric balance, mesic grass, herbs or shrub species (more sclerophilous/xerophytic shrub) patches would develop at the record's surrounding areas.

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
Acaena	Mostly <i>Acaena ovalifolia</i> , <i>Acaena poeppigiana</i> , <i>Acaena pinnatifida</i>	Positive	Mesic herbs	Sottile et al., 2015; Correa MN (1969-1999);
Asteraceae tribe Mutisieae	<i>Perezia</i> spp. <i>Leucheria</i> spp.	Positive	Mesic herbs	Sottile et al., 2015, Correa MN (1969-1999)
Brassicaceae	<i>Cardamine</i> sp.	Positive	Mesic herb	Correa MN (1969-1999)
Calceolaria	<i>Calceolaria</i> spp.	Positive	Mesic herbs	Correa MN (1969-1999)
Caryophyllaceae	<i>Cerastium arvense</i> <i>Stellaria nemorum</i>	Positive	Mesic herbs	Sottile et al., 2015
Empetrum	<i>Empetrum rubrum</i>	Positive	Mesic shrub	Sottile et al., 2015
Gaultheria	<i>Gaultheria mucronata</i>	Positive	Mesic shrub	Sottile et al., 2015
Geraniaceae	<i>Geranium molle</i>	Positive	Mesic herbs	Sottile et al., 2015; Correa MN (1969-1999)
Hypochaeris	<i>Hypochaeris incana</i>	Positive	Mesic herbs	Sottile et al., 2015; Correa MN (1969-

				1999)
Monocotyledoneae	<i>Sisyrinchium</i> sp. <i>Solenomelus</i> sp. <i>Tristagma patagonicum</i>	Positive	Mesic herbs	Boelcke et al., 1985; Correa MN (1969-1999)
Onagraceae	<i>Oenothera odorata</i>	Positive	Mesic herbs	Boelcke et al., 1985; Correa MN (1969-1999)
Plumbaginaceae	<i>Armeria maritima</i>	Positive	Mesic herbs	Boelcke et al., 1985; Correa MN (1969-1999)
Poaceae	<i>Festuca gracillima</i> , F. <i>pallescens</i> , <i>Stipa speciosa</i> <i>Poa rigidifolia</i>	Positive	Mesic herbs	Boelcke et al., 1985; Correa MN (1969-1999)
Ranunculaceae	<i>Anemone multifida</i>	Positive	Mesic herbs	Sottile et al., 2015
Adesmia	<i>Ademia boronoides</i>	Negative	Xerophytic shrub with succulent glandulous leaves	Boelcke et al., 1985; Correa MN (1969-1999)
Asteraceae subf. Asterodeae	<i>Senecio filaginoides</i> <i>Nardophyllum bryoides</i> . <i>Baccharis magellanica</i> <i>Chiliotrichum diffusum</i> .	Negative	Hairy and sclerophilous shrubs	Correa MN (1969-1999)
Azorella	<i>Azorella trifurcata</i>	Negative	Xerophytic dwarf shrub	Correa MN (1969-1999)
Chenopodiaceae	<i>Chenopodium</i> sp.	Negative	Succulent xerophytic herb	Correa MN (1969-1999)
Lycium	<i>Lycium chilense</i>	Negative	Sclerophilous shrub	Correa MN (1969-1999)
Mulinum	<i>Mulinum spinosum</i>	Negative	Xerophytic shrub	Correa MN (1969-1999)
Nassauvia type	<i>Nassauvia glomerulosa</i> ; <i>N. ulicina</i>	Negative	Xerophytic Dwarf shrub	Correa MN (1969-1999)
Schinus	<i>Schinus</i> sp.	Negative	Xerophytic shrub	Correa MN (1969-1999)

Site Name: Mallín La Tercera

Vegetation description: La Tercera area is located in the southern shore of Lake San Martin (49° 11'S; 72° 22'W), at the grass steppe at 15 km to the Subantarctic Forest – Patagonian Steppe ecotone. Wetlands, such as Mallín La Tercera, are common in depressions within glacial deposits. Around Lake San Martin, the grasslands are dominated by *Festuca*. Other grasses found in the area are *Poa ligularis* and *Stipa chrysophylla*. Also, *Carex andina*, *Polygala darwiniana* are present. To the east, the dwarf-shrub steppe grows in areas where the precipitation is lower than 200 mm mean annual precipitation and is characterized by woody elements of low height and cover. The main species are *Nassauvia*, *Chuquiraga*, *Acantholippia*, *Brachyclados* and *Ephedra*. The herbs *Plantago patagonica* and *P. correae* are native species of this vegetation unit. Paleohydric pollen index for this site reflects changes in steppe communities between more mesic grass, herbs or shrub species versus more sclerophilous shrub / xerophytic herbs species abundance around the record area. We assume that during periods of above (below) hydric balance, mesic grass, herbs or shrub species (more sclerophilous shrub / xerophytic herbs) patches would develop at the record's surrounding areas.

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
Campanulaceae	<i>Pratia repens</i>	Positive	Mesic herb	Correa MN (1969-1999);
Convolvulaceae	<i>Convolvulus arvensis</i>	Positive	Mesic herb	Correa MN (1969-1999)
Empetrum	<i>Empetrum rubrum</i>	Positive	Mesic shrub usually common in humid soils	Correa MN (1969-1999)
Euphorbiaceae	<i>Euphorbia</i> sp.	Positive	Mesic herb	Correa MN (1969-1999)
Gaultheria	<i>Gaulthera mucronata</i>	Positive	Mesic shrub	Sottile et al., 2015
Lamiaceae	<i>Scutellaria nummulariifolia</i>	Positive	Mesic herb	Boelcke et al., 1985 ; Correa MN (1969-1999)
Liliaceae	<i>Tristagma patagonicum</i>	Positive	Mesic herb	Boelcke et al., 1985 ; Correa MN (1969-1999)
Malvaceae	<i>Lecanophora subacaule</i>	Positive	Mesic herb	Boelcke et al., 1985 Correa MN (1969-1999)
Poaceae	<i>Festuca gracillima</i> , <i>F. pallescens</i> , <i>Stipa speciosa</i> <i>Poa rigidifolia</i>	Positive	Mesic herb	Boelcke et al., 1985; Correa MN (1969-1999)
Polemoniaceae	<i>Gilia laciniata</i>	Positive	Mesic herb	Correa MN (1969-1999)

Ranunculaceae	Anemone multifida Caltha sp.	Positive	Mesic herb	Sottile et al.,2015; Correa MN
Valeriana	Valeriana carnosa	Positive	Mesic herb	Correa MN (1969-1999)
Asteraceae subf. Asterodeae	Senecio filaginoides Nardophyllum bryoides. Baccharis magellanica Chiliotrichum diffusum. Brachyclados sp., Acantholipia sp.,	Negative	Sclerophilous shrubs	Correa MN (1969-1999)
Azorella	Azorella trifurcata	Negative	Xerophytic Dwarf shrub	Correa MN (1969-1999)
Fabaceae	Adesmia boronoides	Negative	Sclerophylous shrub	Correa MN (1969-1999)
Ephedra	Ephedra triandra	Negative	Xerophytic herb	Correa MN (1969-1999)
Mulinum	Mulinum spinosum	Negative	Xerophytic shrub	Correa MN (1969-1999)
Nassauvia type	Nassauvia glomerulosa; N. ulicina	Negative	Xerophytic Dwarf shrub	Correa MN (1969-1999)
Plantago	Plantago uniglumis Plantago semperviroides	Negative	Sclerophilous herb and dwarf shrub	Boelcke et al., 1985 Correa MN (1969-1999)
Solanaceae	Lycium chilense	Negative	Sclerophilous shrub	Correa MN (1969-1999)

Site Name: Mallín Cabo Vírgenes

Vegetation description: It is located at 52° 19'45"S; 68°23'W. Vegetation communities belong to Magallanian steppe, dominated by *Festuca gracillima*, which extends by plateaus and slopes. Under different hydric balance conditions we can distinguish a dry steppe of *F. gracillima* with *Nardophyllum bryoides*, *Berberis* and cushion plants (*Nassauvia*, *Ephedra*) and a more humid steppe where *F. gracillima* is accompanied by *Chiliotrichum diffusum* and *Empetrum rubrum* shrublands. Mollines are present in valleys and ravines. Paleohydric pollen index for this site reflects changes in steppe communities between humid steppe species versus dry steppe species around the record area. We assume that during periods of above (below) hydric balance, humid steppe species (dry steppe species) would develop at the record's surrounding areas.

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
Asteraceae subf. Cichoroideae	<i>Hypochaeris</i> spp.	Positive	humid steppe species	Boelcke et al., 1985 ; Correa MN (1969-1999)
Caryophyllaceae	<i>Colobanthus subulatus</i> , <i>Cerastium arvense</i>	Positive	humid steppe species	Boelcke et al., 1985 Correa MN (1969-1999)
Cyperaceae	<i>Carex andina</i> , <i>C. argentina</i>	Positive	humid steppe species	Boelcke et al., 1985 Correa MN (1969-1999)
Empetrum	<i>Empetrum rubrum</i>	Positive	humid steppe species	Boelcke et al., 1985 ; Correa MN (1969-1999)

Brassicaceae	<i>Draba</i> sp. <i>Xerodraba</i> sp.	Negative	Dry steppe species	Boelcke et al., 1985 Correa MN (1969-1999)

Site Name: Bajo de la Quinta

Vegetation description: The predominant geoforms and soil types in this landscape determine spatial heterogeneity of vegetation ranging from psammophytic/halophytic community on the sand dunes along the coast (*Hyalis argentea*, *Calycera crassifolia* and *Atriplex lampa*, *Suaeda divaricata* dominate on depressions with salty soils) to xerophytic shrublands to inland such as, *Larrea divaricata*, *Chuquiraga erinaceae*, *Senna aphylla*, *Bougainvillea spinosa*, *Monttea aphylla*. Xerophytic shrublands are associated with clay loam soils. These substrates allow greater water availability, related to a higher storage capacity, which favors shrub, grass and herbs development. So, water availability and different edaphic conditions are probably leading to this community differentiation. Monte shrub communities are organized as two-phase mosaic composed by a phase of perennial grasses and shrub-dominated patches alternating with sparse cover (Ares et al., 2003; Bertiller et al., 2004; Bisigato et al., 2009). Ephedra and Cactaceae present morphological features to support long periods of below hydric balance conditions. Paleohydric pollen index for this site reflects changes in Monte shrub steppe species abundances comparing highly drought tolerant species versus low drought tolerant species around the record area. We assume that during periods of above (below) hydric balance, low drought tolerant species (highly drought tolerant species) patches would develop at the record's surrounding areas.

Pollen type	Species source	Pollen-hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species

Site Name: Lake Trébol

Vegetation description: Lake El trébol is surrounded by a closed and highly diverse mixed Nothofagus dombeyi-Austrocedrus chilensis forest (Ezcurra and Brion, 2005). Today this site is highly impacted by urbanization. Paleohydric pollen index for this site reflects changes in canopy closure. We assume that during periods of above (below) hydric balance, closed (open) canopy patches would develop at the record surrounding areas.

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species

Site Name: Lake Theobald

Vegetation description: The slopes above 1500 m asl are dominated by deciduous forest of *Nothofagus pumilio* and *Nothofagus antarctica* intercalated with humid forest elements like *Fitzroya cupressoides*, *Drimys winteri*, *Berberis*, *Azara microphylla*, *Escallonia alpina* and *Gaultheria caespitosa* are common in the underbrush together with diverse herbs and grasses (*Lycopodium paniculatum*, *Sisyrinchium* sp., *Blechnum auriculatum*). Between 1000 and 1500 m asl the humid forest with *N. dombeyi*, *Saxegothaea conspicua* and *Laurelia philippiana* extends on the slopes. Paleohydric pollen index for this site reflects changes between deciduous forest and humid forest abundance around the record area. We assume that during periods of above (below) hydric balance, humid (deciduous) forest patches would develop at the record surrounding areas.

Solanaceae	Lycium sp.	Negative	shrub-grass steppe	Correa MN (1969-1999)

Site Name: Mallín Pollux

Vegetation description: The vegetation of uplands east and southeast of Lago Pollux is pastureland marked by fallen and burnt logs, testimony to primarily 20th century clearing of the deciduous Subantarctic *Nothofagus pumilio* forest for ranching activities (Markgraf et al., 2007). Remnants of this forest still cover the hills to the north and east of Lago Pollux. Evergreen *Nothofagus betuloides* and other rainforest elements are found as remnants about 10km west of L. Pollux. A dense shrub belt of *Nothofagus antarctica* and *Escallonia rubra* covers the drier areas of the Cyperaceae fen. Eastward vegetation steppe is dominated by Poaceae with many shrubby taxa in the Asteraceae family and great diversity of herbs (Markgraf et al., 2007). Paleohydric pollen index for this site reflects changes in forest patches versus steppe patches abundance around the record area. We assume that during periods of above (below) hydric balance, forest (shrub-grass steppe) patches would develop at the record's surrounding areas.

Pollen type	Species source	Pollen- hydric balance type indicator (relative to this record)	Plant functional type	References about morphoecological features of plant species
