Received and published: 12 May 2015

After looking over the paper, and briefly the reviews, I would like to suggest that the authors take care in their response to address the question of whether or not this paper should be combined with its companion paper. I assume that the authors had good reason to keep them separate, but since several reviewers raised this issue, and I believe it may also have been raised in the reviews of the companion paper, a statement about why the two papers should remain separate would help the review process along.
