

## ***Interactive comment on “Pleistocene glacial variability as a chaotic response to obliquity forcing” by P. Huybers***

**J. Guiot (Editor)**

guiot@cerege.fr

Received and published: 19 March 2009

Your ms has been positively commented by two reviewers and one editor (M. Crucifix). They acknowledge that the paper is well written and should be published. I encourage you to prepare a new version of the paper with argued replies. An effort should be made to better explain that your model is not just an elegant exercise but has clear and unquestionable implications for the understanding climate mechanisms. I need particularly to obtain clear replies on the instability of the 40 kyr cycle (difficulty to reproduce it), the physical realism of the model and the previous work of Saltzman. With my best regards J. Guiot
