Received and published: 23 April 2010

The paper has received two reviews, both of them positive about the paper but suggesting some improvements in style and content. I agree with the reviewers that the paper presents some important new data and most importantly, some new observations about the nature of millennial-style change in MIS5. I therefore strongly encourage the authors to prepare a new version for CP, after first responding to each review comment and taking them into account in their revision.
