Figure S2: Chronological framework of core MD03-2628 over the last 350 ka based on two different reference records: a) Chronology based on the composite $\delta^{18}\text{O}$ record of Asian stalagmites dated by Uranium-Thorium compiled by Cheng *et al.* (2009) used for isotopic stratigraphy (orange curve), the *Globigerinoides ruber* $\delta^{18}\text{O}$ record of core MD03-2628 (black curve and full circles) and the age versus depth relationship of core MD03-2628 (black curve and empty squares). b) Chronology based on the Antarctic CO₂ record with the Kawamura *et al.* (2007) chronology based on the O₂/N₂ ratio used for isotopic stratigraphy (green curve), the *Globigerinoides ruber* $\delta^{18}\text{O}$ record of core MD03-2628 (black curve and full circles) and the age versus depth relationship of core MD03-2628 (black curve and empty squares). Black dashed lines in a) and b) indicate the correlation pointers established with the Analyseries software (Paillard *et al.*, 1996). Records are correlated by mainly using the maximum and minimum $\delta^{18}\text{O}$ values indicating maxima of glacial and interglacial stages, respectively.

Age model from Sepulcre *et al.* (2009)

Age model based on Asian stalagmite $\delta^{18}\text{O}$ records

U/Th-dated from Cheng *et al.* (2009)

Age model based on Antarctic CO_2
with Kawamura *et al.* (2007) chronology

Figure S3: The age versus depth relationship of core MD03-2628 based on different chronologies that are i) the original published chronology from Sepulcre *et al.* (2009) (blue curve), ii) the age model based on the composite $\delta^{18}\text{O}$ record of Asian stalagmites dated by Uranium-Thorium compiled by Cheng *et al.* (2009) (orange curve) and iii) the chronology based on the Antarctic CO_2 record with the Kawamura *et al.* (2007) age model (green curve).

Figure S4: Variations in the $\delta^{18}\text{O}$ of seawater relative to modern values (noticed $\Delta\delta^{18}\text{O}$) at the core MD03-2628 location calculated using the reference records of a) Bintanja and van der Wal (2008) and b) Waelbroeck *et al.* (2002) to correct from the ice-volume effect. The different curves represent calculations of the $\Delta\delta^{18}\text{O}$ of seawater by using various estimations of the global oceanic $\Delta\delta^{18}\text{O}$ that takes into account an uncertainty of ± 2.5 ka in the age model. c) Mean variations for the $\Delta\delta^{18}\text{O}$ of seawater relative to modern values at the core MD03-2628 location as a proxy for past sea-surface salinities (SSS). The black bold line is the average of all ice-sheet volume effect corrections from a) and b).

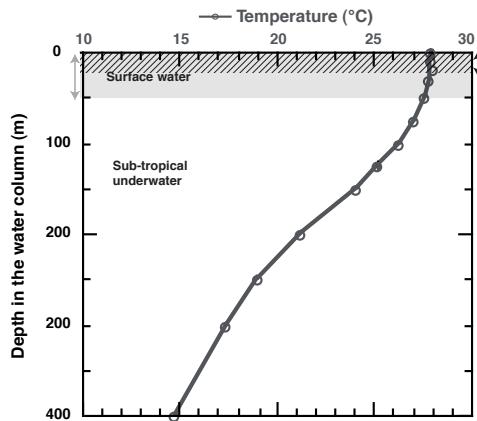

Figure S5: Depth profiles of present-day annual temperature (gray line and open symbols) at 17.5°N 77.5°W (LEVITUS, 1994). Surface and subsurface water masses flowing at the core site are also reported. Gray and shaded areas: living depths of coccolithophorids (Kameo et al., 2004) and of planktonic foraminifera *Globigerinoides ruber* (Schmuker and Schiebel, 2002), respectively.
