

Figure S1. Age models of the seven NALPS stalagmites calculated (see Methods). The U-Th data points are fitted by an age-depth function and calculated 95%-confidence intervals (thin grey curves).

Figure S2. NALPS compared to Northern Hemisphere summer insolation (Laskar et al., 2004). The precursor-type events (see text) are typically associated with insolation maxima, while the rebound-type events correspond to times of relatively low summer insolation. D-O cycles are indicated by the grey numbers.
