Dear Authors,

two reviewers have given predominantly critical comments. You are now required to answer their reviews in detail. I think that the data and data analysis are significant contributions. A revised paper could be accepted for publication in CP, provided that the main suggestions (in particular made by reviewer 1) can be followed. These include a more clear "climatological" interpretation, and a critical discussion of the issues raised

C1678

concerning the relative importance of melting and sublimation.

I'm looking forward to see your comments, and a revised manuscript for CP, Volker Rath
