Received and published: 19 December 2011

Dear authors,

Two referees have submitted comments concerning your manuscript. Both referees are positive and find your results interesting. They also provide several useful suggestions for improvement. You are now invited to reply to all points raised by referees.

I also encourage you to prepare a revised version for CP in which you account for all comments. In particular, please carefully consider the following two important points: 1) the assumption that the surface climate is in quasi-equilibrium after 50 years of simulation should be discussed in more detail, and 2) the results should be compared in more detail with results from PMIP1 and PMIP2 simulations.

C2093

Kind regards

Hans Renssen
