Dear authors

Review comments have now been received by 2 referees which both are in favour of publication of your manuscript presenting for automated layer counting which is rather easy to implement. But both ask for a more rigorous testing of the method with more challenging data sets. In the mean time you have replied to the review comments and outlined additional tests performed with your method on real data.

Given the shortness of the initial manuscript I am sure that these additional tests can be included in a revised manuscript and adequately discussed. In summary I encourage submission of a revised version of the manuscript that includes this discussion and

C1367

assesses the robustness of your method.

Looking forward to reading the revised version

Hubertus Fischer
