

Interactive comment on “Vegetation dynamics in the Northeastern Mediterranean region during the past 23 000 yr: insight from a new pollen record from the Sea of Marmara (core MD01-2430)” by V. Valsecchi et al.

Anonymous Referee #1

Received and published: 28 September 2012

Authors have improved their arguments and interpretations according to new references. The LGM and Late-glacial climatic interpretations based on dinoflagellate and pollen assemblages remains still an issue that may be related to a chronological inaccuracy. However, the paper as a whole worth to be published. Future palaeo-records and their correlation to this record will help solving the discrepancies.

My suggestion is that the paper to be accepted for publication in CP.
