Received and published: 31 October 2012

All three reviewers see merit in the manuscript but also suggest that it requires some major revisions, especially concerning the method to standardize the dendrochronologies and the implied interpretation about the magnitude of the reconstructed low-frequency variability. The authors have responded to two of three reviewers. My impression is that the authors basically agree with the suggestions provided by all of them and their intention is to revise the manuscript along those lines. The editor thus encourages a submission of a revised version but also would like to stress that the comments provided by reviewer #3 are also relevant, in particular those concerning
