Thanks to this international research group for publishing such a nice, provocative and innovative paper on Caspian sea-level changes during the last 1000 years. This publication, integrating high-resolution bio-sedimentary proxies, cartographic data and historical archives allows the authors to propose a new RSL scenario. The history of the drowned harbours is particularly fascinating. However, the absence of the original texts in Persian, Turkish and Arabic with an English translation could be useful for future research. Well done!
