Received and published: 2 August 2013

Dear authors,

The two reviews of your manuscript converge on the fact that it needs major revision in order to better highlight your work and the results. In particular they request to better link changes in soil characteristics and climate/vegetation response, to critically assess the performance of the soil scheme and to provide a convincing analyses of the results. In addition they point out that the manuscript is poorly written and that the introduction is not fully in line with the core of the manuscript. I therefore recommend that you seriously take these remarks into consideration and address the different points raised by the reviewers when revising your manuscript.
