

***Interactive comment on “The impact of early
Holocene Arctic Shelf flooding on climate in an
atmosphere–ocean–sea–ice model” by
M. Blaschek and H. Renssen***

This contribution deals with an important topic in Arctic-related paleoclimatic studies. As I don't have enough expertise to evaluate the quality of the modeling experiment, I can only comment on the general paper design and presentation (I conditionally mark the "Scientific quality" field as Excellent - please consider it blank). Overall, the paper is well designed, with a reasonable hypothesis and a detailed discussion of its testing. The conclusions appear to be sound, but again I cannot assess their substantiation by the modeling. The presentation is generally good, but the writing could be improved in some places. I am attaching a file with some suggestions how to

C1758

make the presentation clearer.
