Received and published: 28 October 2013

Dear authors,

Two reviewers have commented on your manuscript. You are now invited to submit a response to all comments and to prepare a revised manuscript in which you address these comments. I recommend submission of this revised manuscript to Climate of the Past. I kindly ask you to specifically pay attention to the following points raised by the reviewers:

- Please discuss the role of sea ice in more detail (reviewer 1).
- Provide a clear definition of the LGM and indicate this in your figures.

C2426

- Please discuss in more detail the origin of the freshwater anomalies: Arctic/Mackenzie, St Lawrence or other?

I look forward to receive your response and revised manuscript.

Kind regards, Hans Renssen (guest editor).
