

Table S1: concentrations of isoGDGTs and brGDGTs. All samples and corresponding depths, method used, isoprenoid and branched GDGT integrated values, TEX86 (Schouten et al., 2002) and BIT index values (Hopmans et al., 2004), Methane Index (MI) values (Zhang et al., 2011), GDGT-2/Crenarchaeol ratios (Weiwers et al., 2011), GDGT-0/Crenarchaeol ratios (Blaga et al., 2009) and GDGT-2/GDGT-3 ratios (Taylor et al., 2013), and #rings-tetra values (Sinninghe Damsté, 2016). Discarded samples based on BIT and #rings-tetra are indicated with an asterisk. Discarded samples with GDGT-0/Crenarchaeol ratio above 2.0 are indicated with a dagger, those with MI values above 0.3 are indicated with a 'double dagger', and those with GDGT-2/Crenarchaeol ratios above 0.4 with quotation marks. Discarded samples taken from mass waste deposits are underlined.

Core	Section	Core interval (cm)	Cum. top depth (mbsf)	Cum. bottom depth (mbsf)	Used method	GDGT-0	GDGT-1	GDGT-2	GDGT-3	Cren	Cren'	GDGT-III	GDGT-II	GDGT-I	TEX86	BIT	Methane Index (MI)	GDGT-2/Cren	GDGT-0/Cren	GDGT-2/GDGT-3	#rings-tetra

Figure S1: All surface water and 0-200 m depth-integrated temperature reconstructions using the TEX_{86} , $\text{TEX}_{86}^{\text{L}}$ and $\text{TEX}_{86}^{\text{H}}$ seawater temperature proxies plotted against age.

Figure S2: As Figure 2, but with black dots indicating TEX₈₆ values from samples that have been discarded for temperature reconstruction. Furthermore, open circles indicate the position of samples taken that did not provide sufficient amounts of GDGTs for reliable TEX₈₆ values.
