

1 Responses to Anonymous Referee #1 on “The effect of high dust amount on the surface
2 temperature during the Last Glacial Maximum: A modelling study using MIROC-ESM”
3 by Cp-2018-2 Ohgaito et al.

4
5 We wish to express our appreciation to the referee for the constructive and insightful
6 comments and suggestions, which have helped us improve our manuscript
7 considerably. In the following, the referee’s comments are written in black and our
8 replies are written in blue.

9
10 **General comments**

11 Overall, I didn’t find this work is placed very well in the context of past studies. How
12 does the dust-cloud scheme used differ from Takemura et al 2009, and Sagoo et al 2017?
13 How comparable is the snow-ageing scheme to Krinner et al 2006, or Ganopolski et al,
14 2010? Please re-write the introduction to better place the current work in the context of
15 past studies. What is different (or the same) as past work? What do you hope to find?
16 What are main uncertainties etc?

17
18 Our aerosol scheme is identical to that of Takemura et al. (2009). Both Takemura et al.
19 (2009) and Sagoo and Strelvmo (2017) implemented parameterizations of interaction
20 between aerosols and ice crystals based on empirically derived formulations following
21 laboratory experiments and observations (i.e., Lohman and Diehl (2006) and DeMott et
22 al. (2015), respectively). The formulations are different but the schemes of Takemura
23 and Sagoo do similar things; both formulate ice nucleation dependent on temperature
24 and aerosol concentration. It should also be noted that the representations of the
25 cloud water phase of climate models are uncertain and all failed to reproduce the
26 amount and distribution of global observations (Komurcu et al. 2014).

27
28 Concerning the ageing scheme, Krinner et al. (2006) used an ageing scheme based
29 on Warren and Wiscombe (1980) and Wiscombe and Warren (1980) and the MIROC-
30 ESM used that of Yang et al. (1997) based on Warren and Wiscombe (1982). Ganopolski
31 et al. (2010) used simple scaling of albedo reduction with dust flux relationship. This
32 information has been added in the introduction and model description sections.

33
34 Our main research objective was to elucidate how glaciogenic dust might influence
35 the global climate, especially surface temperature. This has been added in the
36 introduction.

37

38 The manuscript has insufficient detail on the methods used, especially on how
39 glaciogenic dust was included. Did you tune the fluxes to the LGM dust observations
40 somehow?

41

42 **In this work, as a first step, we forced additional dust emission constantly following**
43 **the estimate of Mahowald et al. (2006). The source areas of glaciogenic dust in the**
44 **MIROC-ESM are shown in Supplementary Fig. A. The source strengths for these areas**
45 **are shown in Table 3 for the non-glaciogenic dust (LGM.a) and the non-glaciogenic**
46 **and glaciogenic dust (LGMglac.a), following Mahowald et al. (2006a).**

47

48 How well does your snow ageing model agree with other schemes (e.g Warren Wiscombe,
49 1980).

50

51 **The snow ageing scheme of the MIROC-ESM is that of Warren and Wiscombe (1982).**
52 **A suitable description has been added in the revised manuscript.**

53

54 Are your LGM results comparable with e.g. Krinner et al 2006?

55

56 **Krinner et al. (2006) suggest that the ageing effect of snow prevents formation of**
57 **permanent snow over eastern Siberia, consistent with our results. An appropriate**
58 **statement has been added in the revised text.**

59

60 You do not include any discussion of potential uncertainties, which would seem to be
61 quite large, especially for dust-cloud interactions. Perhaps summarise the approach in
62 SPRINTARS compared to other models (e.g. Komurcu et al., 2014).

63

64 **Yes, we agree the uncertainty of the aerosol–cloud interaction cannot be overlooked.**
65 **Komurcu et al. (2014) provided an overview of the uncertainty among the major**
66 **models and they reported wide ranges of uncertainty in both magnitude and spatial**
67 **distribution; therefore, our results might differ from other schemes.**
68 **Acknowledgement of this possibility has been added in the discussion section.**

69

70 Are your dust cloud effects in agreement with those presented for e.g. 'high dust' by Sagoo
71 et al 2017? If not, could you speculate as to why.

72

73 In terms of the global mean, the negative radiative effect of dust is consistent with
74 Sagoo and Strelmvo (2017) and other studies. In the mid- to low latitudes, our results
75 are also consistent with those previous works with regard to cooling. However, in the
76 high latitudes, our results of warming via high dust deposition contrasted with their
77 findings. Because Sagoo and Strelmvo (2017) did not conduct a standard LGM
78 experiment (they changed only CO₂ and dust from their control experiment), it is not
79 possible to specify a reason for this. However, their “idealized high dust” means that
80 their emission factor is about 3.4 times that of the control experiment, globally,
81 whereas our glaciogenic dust sources are located in the high latitudes. Therefore, it
82 is likely that the influence of regions of glaciogenic dust emission such as the Pampas
83 of South America on surface temperature around Antarctica is more pronounced in
84 our simulation results. This analysis has been added in the discussion section.

85

86 Please also could you explain why the dust-cloud effects are so important in the southern
87 hemisphere, but not in the northern hemisphere, and also why the reverse is true for the
88 snow-ageing. Could you expand figure 9 to compare the radiative perturbations from the
89 3 separate effects of dust that you have studied. Hence, I would recommend major
90 revisions to the text before publication.

91

92 **Snow ageing in the MIROC-ESM is tuned to fit the observations in Aoki et al. (2006).**
93 **According to Aoki et al. (2006), it can be considered (approximately) that albedo starts**
94 **to reduce with snow impurity of ≥ 10 ppmw. Dust deposition over the northern high**
95 **latitudes is of the order of $100 \text{ g m}^{-2} \text{ y}^{-1}$, which corresponds to the order of 1000 ppmw.**
96 **Conversely, dust deposition near Antarctica is about $0.01 \text{ g m}^{-2} \text{ y}^{-1}$, which corresponds**
97 **to the order of 0.1 ppmw**

98

99 **Glaciogenic dust travels higher into the troposphere in the Southern Hemisphere and**
100 **it promotes ice nucleation. Additionally, the dust deposition flux of the standard LGM.a**
101 **is higher than Pl.a in the Northern Hemisphere but lower in the Southern Hemisphere.**
102 **Therefore, the impact of glaciogenic dust might be more efficient in the Southern**
103 **Hemisphere. This has been explained in Sect. 3.3.**

104

105 **Specific comments**

106 Page 3, lines 3 to page 4 line 2. This whole section could be summarised more succinctly
107 for the reader. What is the main message from all previous work? What were the main
108 steps? I would say, most studies simulate a cooling effect, but it is variable and that the

109 introduction of (i) vegetation feedback (Mahowald et al 1999), and (ii) glacio genic sources
110 (Mahowald et al 2006) and (iii) dust-cloud interactions (Takemura et al 2009, Sagoo et
111 al 2017) are the main developments.

112

113 **The introduction has been rewritten more succinctly following your suggestions.**

114

115 Page 4: Lines 3-11. I find it incomplete here to only list the inclusion of the ocean. You
116 should also mention the dust-cloud interactions and the dust on snow effects and the
117 inclusion of glaciogenic sources in this study.

118

119 **The sentence has been modified according to your suggestions.**

120

121 Page 5: lines 3-4: Did you reduce the imaginary part of the dust refractive index as done
122 by Takemura et al 2009 (their page 3063)?

123

124 **Our aerosol module (SPRINTARS) is identical to that of Takemura et al. (2009). The**
125 **refractive index of dust aerosols was taken from Deepak and Gerber (1983), but its**
126 **imaginary part was reduced for consistency with recent measurements of weaker**
127 **shortwave absorption.**

128

129 Page 6: Lines 5-6. More detail of the glaciogenic model setup is required. Did you
130 optimise the fluxes from the emissions using the ice-core data, or marine data or both?
131 What simulations did you use to calculate this? Or did you simply scale emissions in
132 these regions to match the emissions simulated by Mahowald et al 2006?

133

134 **Our method is simple. As a first step, to develop a more sophisticated method for**
135 **obtaining a best fit to the proxy data archive, we specified the area of glaciogenic dust**
136 **emission (Supplementary Fig. A) and allowed the emission of a constant dust flux**
137 **following the estimate of Mahowald et al. (2006). The next step will be to introduce a**
138 **more realistic method for the emission of glaciogenic dust. We intend to investigate**
139 **this in subsequent research using an updated version of the MIROC model, which is**
140 **now under preparation for the submission of experiments to PMIP4. Here, we**
141 **acknowledge that we adopted a simple method but it was shown successful in**
142 **obtaining better dust deposition distribution in comparison with the proxy data.**
143 **Improvement of the scheme is certainly required; however, we think even if a**
144 **difference in amplitude is derived, the main conclusion will still hold.**

145

146 Page 9: lines 13-16: Isn't it more likely that this small 1 degree shift, is showing that the
147 effect is small over North America? Your argument seems to be that a much higher
148 resolution model would be more sensitive, but I can't see why this should necessarily be
149 the case? Perhaps I have misunderstood.

150

151 **We agree that the sentences were confusing and we have rewritten them.**

152

153 Figure 8: Can I suggest you separate this plot out into several panels for clarity?

154

155 **For clarity, the shading has been changed to be semi-transparent.**

156

157 Figure 9: It would be nice to compare the dust-radiation, dust-cloud and dustcryosphere
158 effects somehow?

159

160 **We have created Supplementary Fig. C. It shows the LGMglac.a-LGM.a anomaly of**
161 **aerosol-radiation and aerosol-cloud interactions for the TOA and the surface.**
162 **Furthermore, it also shows the same format without the snow ageing effect. The**
163 **panels clarify that the snow ageing effect on the radiative perturbation is minor. The**
164 **figure also clarifies that the anomaly of aerosol-radiation interaction tends to be**
165 **significant at the level of 0.1 W m^{-2} , whereas the significance of the aerosol-cloud**
166 **interaction is difficult to determine. Nevertheless, the positive anomaly around**
167 **Antarctica at the surface is significant.**

168

169

170 Table 2: Takemura et al 2009 quote -0.9 Wm^{-2} for the net dust-cloud effect at the LGM
171 relative to the PI, but your LGM.a -PI.a difference is only -0.36 Wm^{-2} . Could you
172 comment on the differences with that older study?

173

174 **The model of Takemura et al. (2009) and ours both use the SPRINTARS aerosol module.**
175 **However, there are differences between the experimental setups for PI and LGM**
176 **experiments and the model version.**

177 **The difference of the global mean value is derived mainly from the different boundary**
178 **conditions for PI. The SST used by Takemura et al. (2009) (Ohgaito et al. 2009; Fig. 1)**
179 **over the warm pool is about 1° warmer than the SST used in this study (Sueyoshi et**
180 **al. 2013; Fig. 4). It suggests different convective activity, resulting in different amounts**

181 of cloud ice and cloud water. This tropical difference influences the global mean value,
182 suggesting that the SST bias of the control experiment could affect both regional and
183 global mean values. This discussion has been added in Sect. 4.

184

185 **Technical comments**

186 Abstract Line 23: "for a first trial": I think you are referring to coupling with the ocean?
187 It might make more sense to say "for testing the dust feedbacks in a fully coupled GCM
188 for the first time" or similar?

189

190 **Thank you for this observation. It has been changed accordingly.**

191

192 Abstract Line 25: Perhaps change "interaction" to "coupling"?

193

194 **This has been changed as suggested.**

195

196 Page 2 line 17: "Although mineral dust aerosol is not the most significant cause of
197 warming, its effect is not negligible because it is the most abundant aerosol." This makes
198 it sound like mineral dust might have contributed to recent warming. Suggest to
199 rephrase as "Mineral dust is the most abundant natural aerosol today."

200

201 **This has been changed.**

202

203 Page 3 Line 13: "where supposed to generate substantial amount of moraine debris
204 during glacial periods" Change "where" to "were". Perhaps include some of the primary
205 references on this topic.

206

207 **The sentence has been changed.**

208

209 Page 4: Line 4: "The feedback of the aerosol to the ocean and sea ice and back to the
210 atmosphere was not taken into account". Technically, in a slab ocean model the sea-ice
211 can respond, only the oceanic circulation is fixed.

212

213 **The sentence has been rewritten.**

214

215 Page 4: Line 19: So the vegetation is not fully dynamic?

216

217 **The dynamic vegetation module simulates global vegetation dynamics and terrestrial**
218 **carbon cycling (Sato et al., 2007) using the output of the physical module, but it returns**
219 **only the LAI and amount of carbon back to the land and atmosphere, respectively.**
220 **Thus, the dynamic vegetation model is loosely coupled with the MIROC-ESM.**

221

222 Page 5 Line 6: "that control" not "correlated to the" Also, do these variables also control
223 the glaciogenic dust flux?

224

225 **This has been changed and explanation added regarding glaciogenic dust.**

226

227 Page 6 line 10: "The emission area is also consistent between the experiments, with little
228 deviation following the land-sea mask of MIROC-ESM" Sorry, I don't follow this.

229

230 **Supplementary Fig. A has been added to clarify the source areas of glaciogenic dust**
231 **used in our experiments and the sentence has been reworded.**

232

233 Page 7, line1: Is it really drier over the Sahara? I would be less surprised if it was
234 stronger winds?

235

236 **Yes, you are correct. Stronger wind is the reason for more dust from desert areas. The**
237 **sentence has been modified appropriately in the revised text.**

238

239 Page 7: line 3: "is probably because of the increased soil moisture, resulting in an
240 enhancement of precipitation" Shouldn't this be "resulting from"?

241

242 **This has been changed accordingly.**

243

244 Page 7 line 21: change "location" to "source".

245

246 **This has been changed accordingly.**

247

248 Page 8 line 10: "It represents the total effect of the glaciogenic dust on radiation towards
249 the earth surface" Do you mean dust-radiation plus dust-cloud plus dust-cryosphere
250 interactions?

251

252 **We mean the total effect of the glaciogenic dust load in the atmosphere toward the**

253 **surface of the earth. The sentence has been rewritten to clarify this point.**
254
255 Page 8 line 19: Repeated sentence.
256
257 **Thank you. The duplicated text has been deleted.**
258
259 Page 9 line 7: Refer to figure 6 here.
260
261 **We have done as you suggested.**
262
263 Page 9: 18-19: Please can you briefly summarise what these are?
264
265 **An appropriate explanation has been added.**
266
267 Page 10 line 16: i.e. it contributes to atmospheric heating.
268
269 **The global mean radiative perturbation by glaciogenic dust is cooling (-0.19 W m^{-2})**
270 **However, glaciogenic dust behaves differently over the polar regions and it**
271 **contributes to atmospheric heating. An appropriate explanation has been added in the**
272 **revised manuscript.**
273
274 Page 13 line 12: "draught" should be "drought".
275
276 **Thank you for identifying this error; it has been changed accordingly.**
277
278 Page 15 line 15-16: How strong is this snow bias in MIROC-ESM? Might be worth shoing
279
280 **Supplementary Fig. H has been added to show that snow cover tends to remain in**
281 **boreal spring over southern Siberia.**
282
283 Figure 8: This caption doesn't completely make sense to me: "Green line denotes
284 LGMglac.naging.a-LGM.naging.a, which means the change arose from non-aging effect
285 of snow albedo." Does this mean that the snow albedo is affected by dust but not by
286 ageing? Also change "Shades" to "Shading".
287
288 **We wanted to say that the "LGMglac.naging.a-LGM.naging.a" shows "the change is**

289 not attributable to the ageing effect of snow". The caption for the figure has been
290 rewritten in the revised text.
