

Interactive comment on “Pollen-based temperature and precipitation changes in the Ohrid Basin (western Balkans) between 160 and 70 ka” by Gaia Sinopoli et al.

Anonymous Referee #2

Received and published: 22 September 2018

Thank you for the opportunity to comment on this manuscript. The manuscript titled ‘Pollen-based temperature and precipitation changes in the Ohrid Basin (western Balkans) between 160 and 70 ka’ covers a sound data set of great value to the palaeoecological community as climate reconstruction for the last interglacial-glacial cycle from this sensitive area are scarce. Overall, I think the work is good and should be published in CP but there are a number of important details that need to be considered and corrected first. In many instances these are related to terminology, definition of terms and ambiguity or circularity in the phrasing. One important example of this is the use of different nomenclatures, e.g., from alpine region (Riss/Würm glacial), from northern/central Europe (Eemian interglacial), and the special nomenclature from France

[Discussion paper](#)

for interstadials/stadials. Regarding the last interglacial, be careful with the statement that the Eemian was not a stable phase in the Balkan region. The last interglacial at LO clearly shows a classical interglacial with an early warming at the beginning of MIS 5e, a climate optimum and a progressive cooling towards the end of the last interglacial. In general, I suggest to interpret the LO record with regard to further regional climate reconstructions (mentioned in the chapter 'Introduction', e.g., LGdM and Ioannina) and use it as a basis for discussing in more global scale with possible correlations to the France, speleothem records, MIS, etc. These important issues and more are detailed below along with some suggestions for grammatical corrections.

Page, Line. Comment

P1, 17. The presented archive covers the period between 160 to 70ka. This includes not only MIS 6 and MIS 5, but also the early part of MIS 4. The authors mentioned it in the conclusion by themselves. (P14, 8).

P1, 25-28. According to the anonymous referee #1. The last interglacial at Lake Ohrid shows a classical interglacial cycle with pre-temperate phase (early warming), temperate phase (climate optimum), and a post-temperate phase (progressive cooling), which is also well described by Tzedakis, 2007. Be careful with this general conclusion of an unstable last interglacial in the Balkan region!

P2, 3. Insert '...MIS' – 6 (penultimate glacial) and MIS 5 (last interglacial complex) are...'

P2, 6. '...the penultimate glacial (or Riss Glaciation) ...' in comparison to P2, 12. 'The Eemian...' Please pay more attention to a uniform nomenclature. The term 'Riss glaciation' is normally used in the alpine area. In northern and central Europe, the penultimate glacial belongs to the 'Late Saale/Saalian Complex'. If you want to continue with the term 'Eemian' for the last interglacial (MIS 5e), you should use the nomenclature of the northern and central Europe. Another example is the '(Early) Weichselian glacial' instead of 'Early Würm' (P2, 34).

P2, 7. Please pay more attention to uniformity. The LIC lasts from ca. 130-80 ka in the chapter 'Introduction', whereas the LIC covers the period from ca. 128-70 ka at page 3, 25. Please check the dates, there are several more discrepancies.

P3, 2-4. The authors mentioned that Ioannina and LGdM have done climate reconstructions based on pollen data. Unfortunately, these two archives were not used for comparison (e.g. in Figure 5) or were not discussed in detail in the text (chapter 5.3), although these records are much closer to Lake Ohrid than the archives in France. Due to the fact that you mentioned in P3, line 15 that the Balkan Peninsula is a key region between the Mediterranean area and the Northern/Central Europe. It would be nice to see how these few southern European records differ from the northern European ones. What about the direct comparison with Lake Prespa, which covers the last ~90 ka. I am not sure if they have done climate reconstructions, but are there any similarities or differences to your record?

P3, 14. ...glacial-interglacial cycle. (?)

P4, 1-2. The first sentence is not necessary.

P4, 11. Avoid the repetition of 'karst aquifers' at the end of line 11.

P4, 12-13. Rephrase: '...small streams, rivers, and by direct precipitation.'

P4, 18. Rephrase: '...during winter and south-southeasterly (or southerly to south-easterly) winds during...'

P4, 21. This context is not clear – please rephrase. What are the four zones? Which species dominate which zone?

P5, 1-3. Please check. This sentence is written in a different language.

P5, 15. What is 'new' in the high-resolution pollen data, presented in this manuscript, when it is already published in Sinopoli et al., 2018? Did you analyse more 'new' samples for this manuscript, which are not shown in the Sinopoli et al. paper? Please

[Printer-friendly version](#)[Discussion paper](#)

clarify!

P5, 34. Which 'six modern analogues'? This subject should be further explained and clarified in the text.

P6, 18. It is not clear to me what do you mean with the '...first analogue and the last analogue...'? More details are needed.

P6, 35-36. Please check. This sentence is written in a different language.

P7, 1. '...and annual precipitation between 350 and 600 mm/yr),...' It depends on what method you looking at. For MAT, I can recognize a fluctuation from 100 to ca. 300 mm/yr in the mean annual precipitation. For WALPS, it fluctuates between 500 to 700 mm/yr. What is the explanation for this huge difference? Please clarify and add some more explanations.

P7, 11 and 14. Which 'other methods'? If necessary, add references.

P7, 34-36. Which is the third part? Furthermore, an additional verb is missing. Please rephrase this sentence.

P8, 17 and following. Describe the 'end of MIS 6' within chapter 4.1

P9, 8 -16. This section should be mentioned in the chapter 'Materials & methods'.

P9, 19-20. To be consistent with the text, could you add the discussed pioneer shrubs (e.g. Juniperus) to the selected pollen diagram (Figure 2).

P9, 28 and following. For the better understanding and demonstration, it would be very helpful to show the comparison of your Eemian climate reconstructions with those from the JO2004 record. Please insert the JO2004 climate reconstruction, for example, in Figure 4.

P10, 12. The phrase '...export of terrestrial organic matter...' sounds a bit odd. Please rephrase.

P10, 18 and 19. Delete ‘...inferred from pollen.’ due to the repetition from the previous sentence. At this point, it is obvious that TANN and PANN were calculated from pollen.

P10, 18-29. There seem to be some logical steps missing. I cannot work out how lake level changes can be visible in the pollen record. I also cannot see a decline in terrestrial vegetation at the end of MIS 6 - in fact, quite the opposite. It shows a continuous increase in mesophilous and coniferous trees! In addition, I assume that significant lake level changes should be reflected in the TIC /TOC values, but again I cannot see any changes in these proxies at the DEEP site. Furthermore, the ‘clearly seen’ change in the pollen record of Co2012 is not presented in this manuscript! These subjects should be explained more clearly in the text.

P10, 31-34. In my opinion, a difference of 500 years is NOT a discrepancy. The authors should soften the language.

P10, 39-41. Please avoid the use of so many ‘and’ in this sentence. Please rephrase.

P10, 42 and following. There is something odd about the line of reasoning here. It is not clear to me what do the authors mean with ‘from 120 ka and culminating at 119.4 ka’? In Fig. 4, I cannot identify a ‘culmination’ in the TIC decrease during this interval. At the DEEP site, the TIC and TOC values already continuously decrease after ca. 126 ka! In addition, how can a progressive drying (P11, 3) take place when precipitation increases at the same time (P11, 1)? By the way, I cannot see an increase in precipitation after 120 ka! Please clarify.

Chapter 5.3. It would be nice to see a direct comparison of climate parameters between Lake Ohrid, LGdM, Ioannina, and the records in France (e.g., in Figure 5). Unfortunately, the southern European records are only summarized in Figure 6. I think it would be helpful for your argumentation. Be careful with simplification of complex interactions! When I am looking at the comparison between LO, Northern Europe, and Southern Europe (Figure 6), I can recognize several different responses to global climate changes in all records. In my opinion, the authors should make it unequiv-

[Printer-friendly version](#)[Discussion paper](#)

ocally clear the transitional position from Mediterranean climate influenced climate to more temperate northern European climate conditions with, e.g., a distinct temperature decrease after 125 ka, which is not that pronounced at LO (more comparable to the southern European records).

P11, 26. The period from 135-105 ka comprises the late MIS 6 to MIS 5c, as you already mentioned it in the next sentence!

P11, 29. In the direct comparison between LO and Grande Pile & Bouchet, there are opposite trends in the anomalies at the end of MIS 6. Between ca. 140-133 ka: high anomalies at LO, low at GP; between ca. 133-128 ka: low anomalies at LO, high at GP. Please clarify.

P12, 11. Delete the repetition of 'Fig.5'.

P12, 18. As I already wrote above, add the 'other pollen records from Lake Ohrid' to the figures. It would be helpful for the following of your argumentation.

P12, 24-35. What is the 'striking feature' of these interstadials, just the occurrence? Add some more explanations. I think these two short-term interstadial can be correlated with the Dansgaard-Oeschger events DO 19 and 20, which are also visible in the eastern Mediterranean records, such as Thenaghi Philippon (Müller et al., 2011) and Lake Van (Pickarski et al., 2015), even though the climate was significantly more continental during this time.

P13, 17 & 23. The ODP-976 record is not presented in the manuscript!

P13, 16-24. There are some important differences visible between LO and other records (e.g., at ODP-977, Villars cave) especially at the early Eemian, which are not discussed in the text. Be careful with generalization! Please add more details and discussed that differences a bit more.

P13, 25 -34. There are some logical steps missing. Which event centered at ca. 115? Melisey I? C25? I am a bit lost in this section! In addition, C25 event is not visible in

[Printer-friendly version](#)[Discussion paper](#)

the SST record! Please clarify!

P14, 5. A period is missing at the end of the sentence.

P14, 8. Insert ‘...Last Interglacial Complex (LIC, 128 to 70 ka),...’ due to the used abbreviation in the next sentence.

P14, 12. ‘...occurring during the late MIS 6, MIS 5 and the early MIS 4.’

Table 1 Please use a uniform nomenclature. It would be nice if you could mark the different MIS 5 stages (MIS 5e to a) in the ‘Marine Stratigraphy’ column.

Figures

Figure 1 Where is the ‘Struga meteorological station’ located? Can you mark it on the map? Please pay more attention to the consistence of facts between the text and the figures. For example, you mentioned in P4, 7 that Lake Ohrid is located at 693 m asl. In your figure 1, it is written 694 m asl. The same discrepancy is evident in the mean annual temperature at Lake Ohrid (P4, line 15).

Figure 2 Perhaps it is better to use the terms ‘Mesophilous taxa/biome’ and ‘Mediterranean taxa/biome’ instead of ‘trees’, because Hedera is not a tree, it is a liane, and Cistus (depending on the species) grows also as shrub. The figure caption is a bit confusing. If you are showing, e.g., only Poaceae within the group of grasslands than delete the additional information that grasslands consist of Poaceae and Cyperaceae. The same goes for ‘Steppe’. Please, show in the first column (left) the MIS 6 to 4 and in the second column the nomenclature of the northern and central Europe. That goes also for the other figures.

Figure 3 MAT method is shown in a blue line, not in black! Regarding GDD5: The legend of the figure is not clear to me. Are these 1000-3000 years over 5°C per year/season/? Are these 1000-3000°C. Please, clarify! Delete the repetition of ‘Blue shading indicates cold periods (Riss glacial and Early Würm glacial stadials)’ in the figure caption.

Discussion paper

Figure A1 What do you mean with 'The last graph represents the'? Figure A2? What outline the different red lines? More details are needed.
