Interactive comment on “A 424-year tree-ring based PDSI reconstruction of Cedrus deodara D. Don from Chitral HinduKush Range of Pakistan: linkages to the ocean oscillations” by Sarir Ahmad et al.

Anonymous Referee #2

Received and published: 26 October 2019

Ahmad et al. presented a reconstructed PDSI time series from tree-ring record for the HinduKush Range of Pakistan where such record is limited. This study will be valuable for understanding long-term drought dynamics in these regions. The method is typical for this type of research, statistical analyses are sound, and results are checked with existing studies. Overall, I find this study is publishable after addressing the following concerns.

1. The logic flow of introduction section is very unclear. The second paragraph is hard to follow. From line#58-61, it is hard to follow why “their distinct and complex
topography, ... ... ..., and unique precipitations seasonaility” makes tress in HKH “im-
portant”? In addition, what is the purpose of mentioning the hydroelectric reservoir?
What is the purpose of comparing 4% from government and 2% from FAO? Moreover,
from Line#73-75, why susceptible to ET, soil and air temperature, air humidity, and soil
moisture makes tree ring highly recommended for dendroclimatic studies? I highly re-
ommend authors fill in these missing logic links to improve readability. 2. Line#153. Do
you have a reason for reconstructing March-August PDSI rather than other period or for
the annual mean PDSI? This should be explained in the main text. 3. Line#166-168.
Do you have a reason for choosing 1 standard deviation to identify drought/wet peri-
ods? Please explain. In addition, the purpose of the second sentence “We assessed
the dry and wet periods for many years based on strength and intensity” is not clear
to me. 4. In Fig. 5, the 1960-2016 is relatively dry. This could bias your regression
equation at Line#198 towards the dry end. I think this is the reason why the mean of
your reconstructed PDSI before 1960 is negative rather than zero. How did you cor-
rect this dry bias? Please explain and add discussions on how this dry bias would
affect your drought identification and conclusions. 5. Figs. 6 and 8 are unreferenced
in the main text. Please correct. In addition, please consider add more explanations
for these two figures. Currently, it is unclear how these two figures support the flow of
your discussions.

The English of this manuscript needs to be polished. The following are a list of errors
that I caught. â€” Line 48, lacking an “and” before “increases risk of wildfires”. â€” Line 57, 80% to 60% of what? â€” Line 63, replace “in the form of” with “from” â€” Line 169, remove “a” before “few”, remove “still”. â€” Line 185-187, please consider
decompose this long sentence into smaller ones. â€” Line 308, is “weather” a good
word for climate-related studies?
