

*Supplement of*

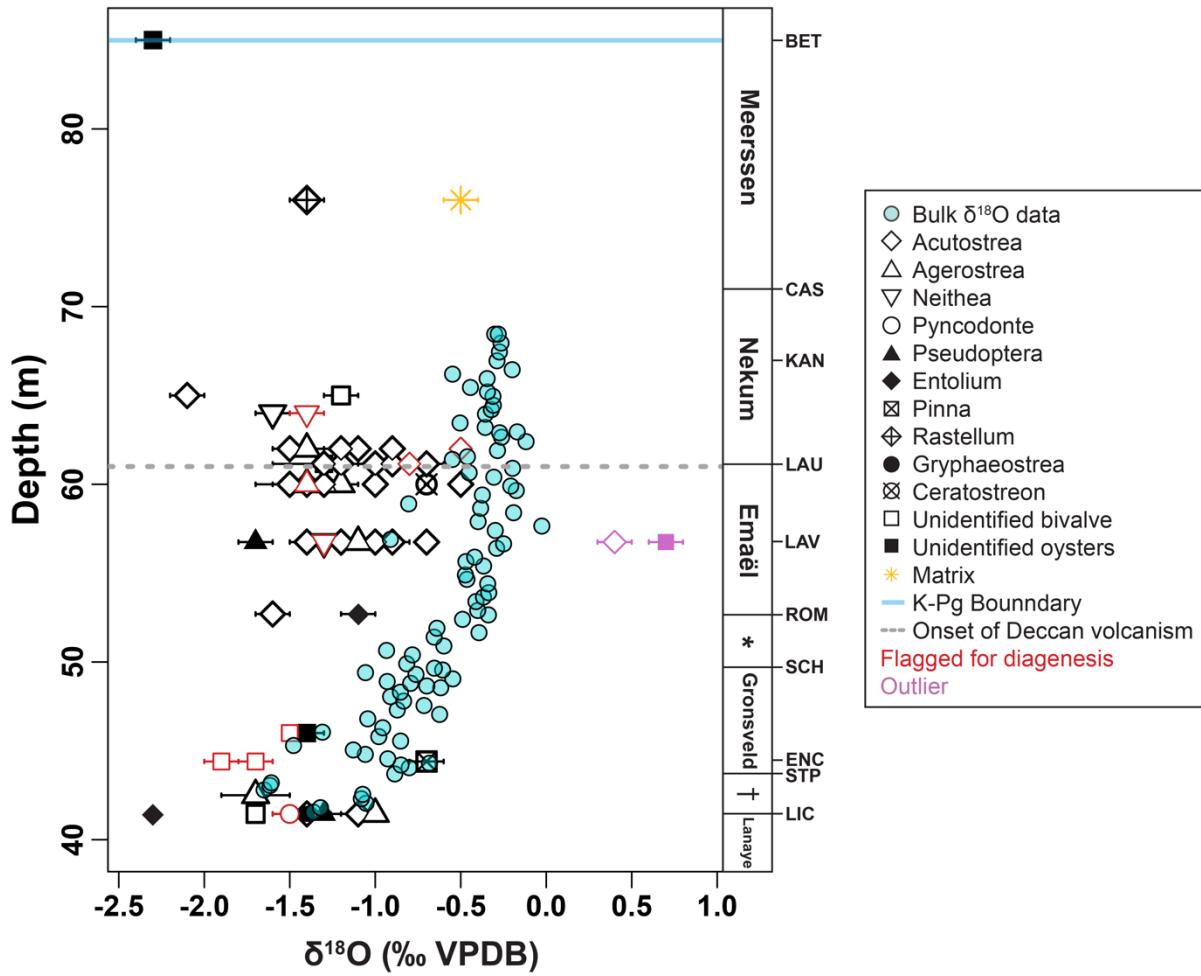

## **Clumped-isotope-derived climate trends leading up to the end-Cretaceous mass extinction in northwest Europe**

**Heidi E. O’Hora et al.**

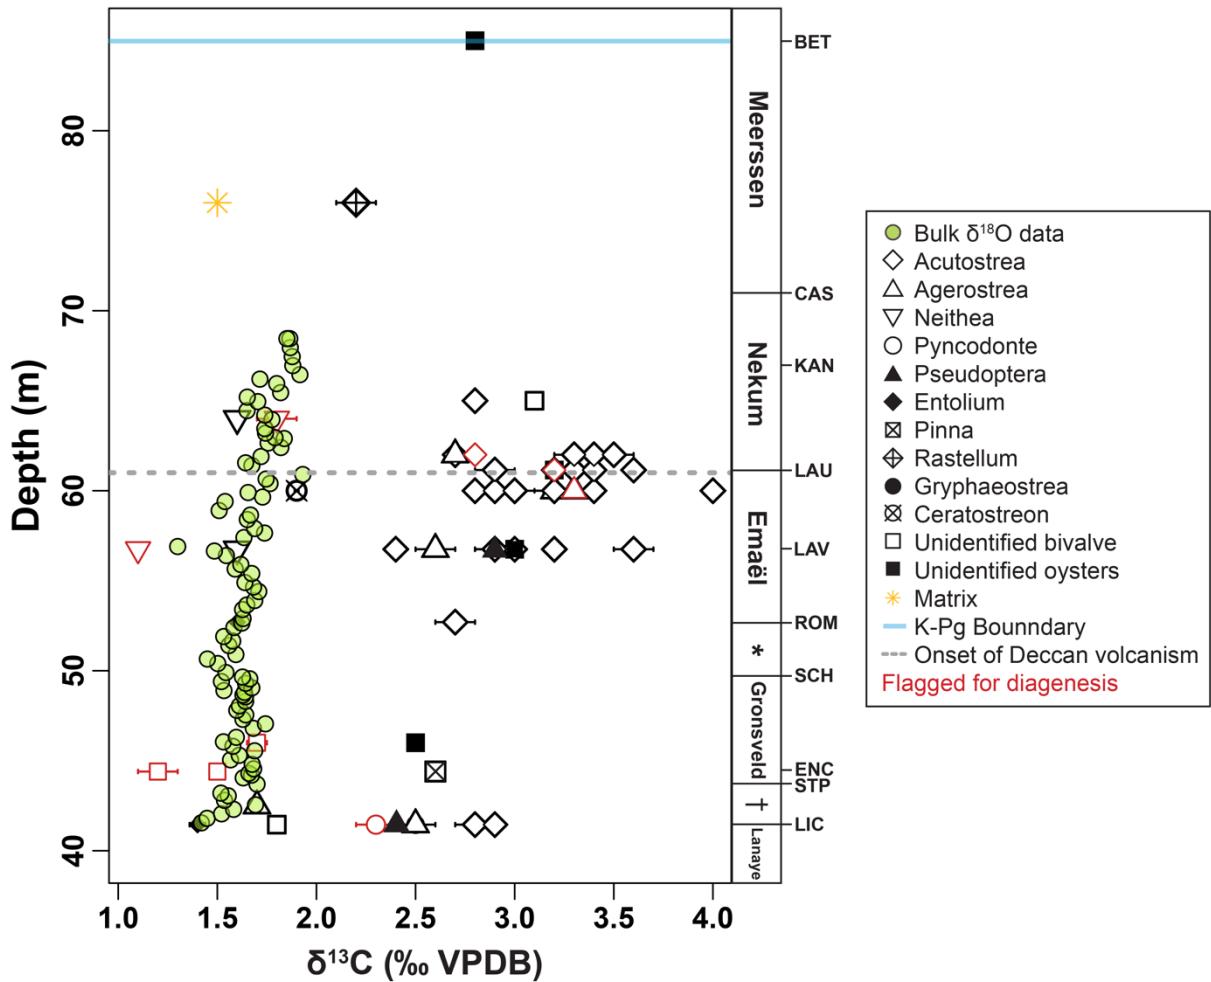

*Correspondence to:* Heidi E. O’Hora (ohora@umich.edu)

### **Contents:**

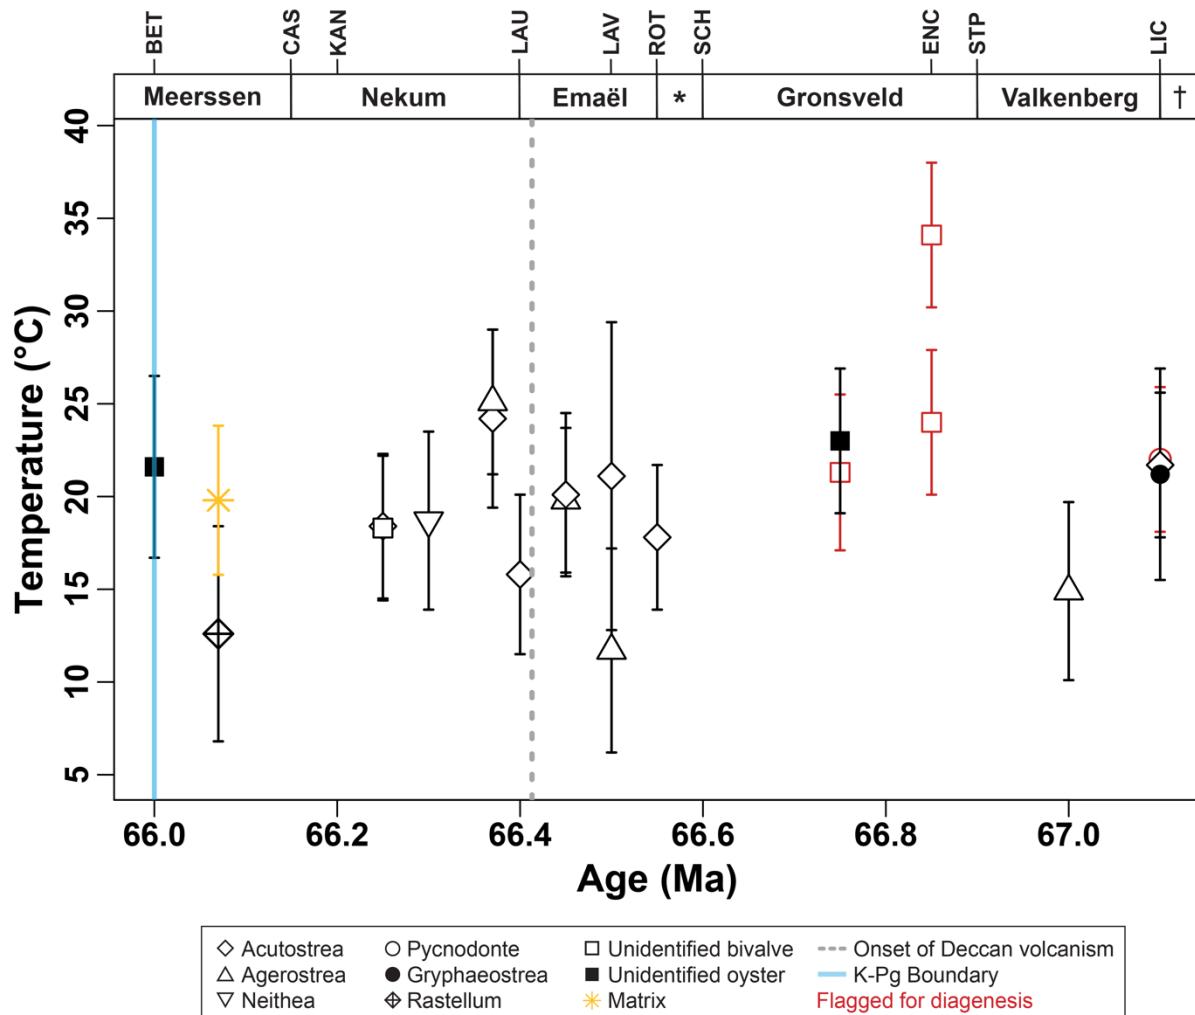

- **Figure S1:** oxygen isotope values of shell specimens and bulk carbonate;
- **Figure S2:** carbon isotope values of shell specimens and bulk carbonate;
- **Figure S3:** all  $\Delta_{47}$ -derived paleotemperature data, including samples removed due to diagenesis;
- **Table S1:** average paleotemperature data for all Maastrichtian-aged studies reconstructing marine temperatures used to create Figure 6;
- **Table S2:** all data for all samples including SEM results, trace elements, stable and clumped isotopes, paleotemperatures, and  $\delta^{18}\text{O}$  of seawater.

**Figure S1: Oxygen isotope values of shell specimens and bulk carbonate.** Bulk carbonate  $\delta^{18}\text{O}$  data from ENCI quarry are from Vellekoop et al. (in prep.). Red data points (flagged for diagenesis by trace element and/or SEM analysis) and purple points (outliers) were excluded from interpretation. If no error bars are visible, the uncertainty is smaller than the size of the symbol. Onset of the main Deccan Traps eruptions (grey dotted line) at 66.413 Ma (Sprain et al., 2019). K-Pg boundary (blue line) at 66.0 Ma. Member names and horizon abbreviations are labeled along right side of figure. Lanaye Member is part of underlying Gulpen Formation. \*Schiepersberg Member; †Valkenberg Member.

**Figure S2: Carbon isotope values of shell specimens and bulk carbonate.** Bulk carbonate  $\delta^{13}\text{C}$  data from ENCI quarry are from Vellekoop et al. (in prep.). Red data points (flagged for diagenesis by trace element and/or SEM analysis) were excluded from interpretation. If no error bars are visible, the uncertainty is smaller than the size of the symbol. Onset of the main Deccan Traps eruptions (grey dotted line) at 66.413 Ma (Sprain et al., 2019). K-Pg boundary (blue line) at 66.0 Ma. Member names and horizon abbreviations are labeled along right side of figure. Lanaye Member is part of underlying Gulpen Formation. \*Schiepersberg Member; †Valkenberg Member.

**Figure S3: All  $\Delta_{47}$ -derived paleotemperature data, including samples removed due to diagenesis.** Red data points (flagged for diagenesis by trace element and/or SEM analysis) were excluded from interpretation. Both internal and external standard error were calculated for all data points, and the larger of the two errors for each point is depicted here as an error bar. Onset of the main Deccan Traps eruptions (grey dotted line) at 66.413 Ma (Sprain et al., 2019). K-Pg boundary (blue line) at 66.0 Ma. Member names and horizon abbreviations are labeled across the top of the figure. \*Schiepersberg Member; †Lanaye Member (of underlying Gulpen Formation).

**Table S1: Average paleotemperature data for all Maastrichtian-aged studies reconstructing marine temperatures used to create Figure 6.** Data from this study is highlighted in red. All paleolatitudes were determined either directly from each study (if given) or via [www.paleolatitude.org](http://www.paleolatitude.org) (van Hinsbergen et al., 2015).

Study	Proxy type	Locality	Approx. age	Paleolat.	Avg. temp. (°C)

Stott and Kennett (1990)	Planktic foraminiferal $\delta^{18}\text{O}$	ODP 690, South Atlantic Ocean	65.5–68.4 Ma	-70	10.6
Wilf et al. (2003)	Planktic foraminiferal $\delta^{18}\text{O}$	ODP 690, South Atlantic Ocean	66.1–66.5 Ma	-70	10.6

**Table S2: All data for all samples including SEM results, trace elements, stable and clumped isotopes, paleotemperatures, and  $\delta^{18}\text{O}$  of seawater.** Red samples were excluded from interpretation due to elevated trace element concentrations and/or SEM analysis. Purple samples were excluded from interpretation due to anomalously high  $\delta^{18}\text{O}$  values. The yellow data are from the matrix sample. In the SEM column, SG means secondary growth and diss means dissolution.
